Rural Municipal Transport Master Plan (RMTMP)

PREPARED BY:

Embark Engineering Services Pvt. Ltd.

New Baneshwor-10, Kathmandu

March, 2021

Acknowledgement

The consultant team would like to take this opportunity to convey sincere thanks and gratitude to elected bodies, executive officer and staffs of the Ghyanglekh Rural Municipality who have helped for overall planning, organizing meetings and so on, from the very beginning to the completion of the report. Again, the team would like to acknowledge the technical team of the Rural Municipality including engineer, planner, overseers, sub-overseers and assistant sub-overseer regarding their technical inputs about road classification, environment friendly planning, etc. The team also expresses sincere thanks to elected bodies and administrative officials of the ward offices who helped for conducting ward level meeting for the collection of demands. Finally, the consultant team would like to express sincere thanks to all the concerned officials of the Rural Municipality who have helped directly or indirectly and contributed at every step up to this phase towards the completion of this project.

Furthermore, the team would like to thank all the Social Mobilizers and the representatives of women and ethnic group of the Rural Municipality for their suggestions for making the plan more inclusive and community friendly. The officials of Department of Roads (DoR) Department of Local Infrastructure Development (DoLI) helped to get the data regarding SRN (Strategic Road Network) and LRN (Local Road Network). The team expresses sincere gratitude to DCC (District Coordination Committee) for online source of DTMP report of the district. The team would like to thank all the local people of the Rural Municipality for their patience and co-ordination during the surveys. Finally, the team would like to acknowledge all the helping hands that were directly or indirectly involved in preparation of this plan.

Executive Summary

Transport facilities help in developing access with the urban linkages. Road accessibility can reduce isolation, stimulate crop production and marketing activities, encourage public services and help to transfer technology. Road building has been seen to bring about notable enthusiasm and visible changes in life. Road infrastructure is considered as "the infrastructure for infrastructure". However, in the absence of notable criteria and rational guidelines, road construction may be carried out in adverse manner resulting in haphazard usage and wastage of limited resources. Rural Municipal Transport Master Plan (RMTMP) is prepared for assessing and planning the present road and transport infrastructures and facilities within the Rural Municipality and its surroundings.

Ghyanglekh Rural Municipality lies in Sindhuli district of Bagmati Province. In 12 March 2017, the government of Nepal implemented a new local administrative structure consisting of 753 local units. With this implementation of the new local administrative structure, VDCs have been replaced with the Municipal and Rural Municipal councils.

The Ghyanglekh Rural Municipality was established by merging the Amale (1-9), Bastipur (1-9), Tamajor (1-9), Netrakali (1-9) and Shanteshwori (1-9) Village Development Committees (VDCs) having a total area of **166.77 sq. kms**. After merging the five VDCs' population it had a total population of **13,661** according to 2011 Nepal census. The population density of Ghyanglekh Rural Municipality is **81.92 person/sq.km**. Ghyanglekh Rural Municipality has altogether 5 wards.

RMTMP started with the formation of Rural Municipal Road Coordination Committee (RMRCC) and the collection of demand and inventory of road within the Rural Municipality. For the collection of existing road infrastructure data, GPS survey was used and total length of road surveyed was **316.55 KMs**. Based on field survey, ward no. 4 has highest length of roads and ward no. 2 has smallest road length among all wards.

Indicative Development Potential Plan is prepared showing the existing and potential market center/service centers (key growth centers) and the areas having various development potentials such as agro-based industries, high value cash crops and tourism. This city may be developed as the agricultural-cultural-historical centre and with promoting this, the tourism

can be improved. By improving the agriculture and tourism sector we have to develop the health, education and environment of the people of this Rural Municipality.

This study formulated the road hierarchy for the various roads namely Class A, B, C and D. Class C and D basically deals with access while Class A and B basically deal with mobility and accessibility to higher services. The minimum right of way, setback, pavement width and footpath width provisions for the different classes of roads are recommended as follows:

SN	Road Class	Min RoW(m)	Setback(m)	Pavement Width(m)
1	A	14/20	1.5/3	11/14
2	B	10	1.5	7
3	C	8	1.5	5.5
4	D	6	1.5	3.75

The total lengths of Class A, B, C and D roads are summarized as shown in the table below:

Class	Road Surface/Approx. Length (Km)				
	Concrete	Earthen	Gravelled	New Track	Grand Total
A	-	63.15	19.83	6.89	89.86
B	0.05	78.45	-	18.43	96.93
C	-	52.29	-	4.52	56.81
D	0.03	102.75	-	93.76	196.54
Grand Total	**0.09**	**296.64**	**19.83**	**123.59**	**440.14**

There are two district roads passing through this Rural Municipality which play important role for intra-Rural Municipality mobility as well as accessibility.

For the development of overall transportation infrastructures there is a need of approximately **1,564.26 crores** of budgets which in summary is as follows:

S. No.	Project	Required Capital
1	Upgrading all roads inside rural municipality with necessary infrastructures	10,900,082,342
2	Maintenance of all roads	4,671,471,000
3	Construction of Bus Park with bus terminal	20,000,000
4	Construction of Bus Stands (1 in each ward)	15,000,000
5	Construction of Helipad for emergency (1 in each ward)	15,000,000
6	Installation of traffic signals at 10 locations	15,000,000
7	Traffic Safety and Signs	3,000,000
8	Road Safety education	3,000,000
Total		**15,642,553,342**

However, the potential of Rural Municipality to invest in transportation infrastructure is **572.75 crore** Nepalese rupees (considering the capital of Rural Municipality increases by 10 percent each year) over twenty years period of time. The Rural Municipality needs to find sources for another **991.51 crore** Nepalese rupees for overall infrastructure development from different sources. The Rural Municipality should collaborate with federal government, province government and private sectors. Similarly, involving people in development works would help to generate revenue for infrastructure development. Likewise, Rural Municipality should increase their internal income through different income generating activities.

For the RMTMP period, the Rural Municipality aims to invest approximately **61.05 crores** of budget through Rural Municipality in road infrastructure construction in the next 5 fiscal years' period and this budget will increase on the years following. This capital is distributed for four classes of roads as follows:

Year	Capacity of Rural Municipality (in Thousands)					Sub Total
	Class A	Class B	Class C	Class D	Maintenance	
1	21,000	14,000	21,000	14,000	30,000	100,000
2	23,100	15,400	23,100	15,400	33,000	110,000
3	25,410	16,940	25,410	16,940	36,300	121,000
4	27,951	18,634	27,951	18,634	39,930	133,100
5	30,746	20,497	30,746	20,497	43,923	146,409
Total	**128,207**	**85,471**	**128,207**	**85,471**	**183,153**	**610,509**

The overall road network along with location points are shown in a interactive online map with satellite basemap. The details of the roads and locations can be obtained from the interactive map through the following link::

https://www.arcgis.com/apps/View/index.html?appid=4c2b73dec27d4cb9823e3655a8c2d8d8

For convenience, the above link has been shortened as::

(Both of the links redirect to the same map.)

Chapter 1: Introduction

1.1. Background

Life in organized human settlements, which are mostly referred to as communities, is only possible if people have mobility in daily basis. Residential area is spatially separated from workplaces, major shopping is concentrated in identifiable centers, and larger entertainment and relaxation facilities are found at specific locations. They have to have accessibility.

Transport facilities help in developing access with the urban linkages. Road accessibility can reduce isolation, stimulate crop production and marketing activities, encourage public services and help to transfer technology. Road construction has been seen to bring about notable enthusiasm and visible changes in life. Road infrastructure is considered as "the infrastructure for infrastructure". However, in the absence of notable criteria and rational guidelines, road construction is carried out in adverse manner resulting in haphazard use and wastage of limited resources.

Haphazard development of settlement in the urban and sub-urban area is a great problem which we have learned from the past earthquake. For disaster risk management and reducing the problem of congestion we should go for planned development. Construction of roads after the settlement is made or extension of road only after the congestion problem creates different types of problems in the society which we are closely observing from different metropolitan cities. In this regard, formulation of Rural Municipal Transport Master Plan was initiated for assessing the present road and transport infrastructures and facilities within the Rural Municipality and the surrounding Rural Municipalities. So as to be presented as proper Rural Municipality or a city, it must have a very good mobility and accessibility by public or private means of transportation.

1.2. Objective of RMTMP

The prime objective of this study is to prepare the Rural Municipal Transport Master Plan (RMTMP) for Ghyanglekh Rural Municipality. The planning approach is participatory and bottom-up from the settlement level. It will include a constructive plan to incorporate all the transportation needs and facilities for now and tomorrow. The specific objectives of the RMTMP are mentioned below:

1. Prepare the Rural Municipal Inventory Map (RMIM) of all road networks.
2. Identify the major road networks linking the Rural Municipality with the surrounding areas.
3. Collection of demands for new/rehabilitation transport linkages from Rural Municipalities/settlements based on city development plan.
4. Prepare the Perspective Plan of transport services and facilities (Rural Municipal Transport Perspective Plan)
5. Prepare physical and financial implementation plan of prioritized roads for the RMTMP period.
6. Prepare a five years Rural Municipal Transport Master Plan (RMTMP).

1.3. Scope and Limitation of RMTMP

The scope of this work and service the consultant will provide for the project is given below:

a. Analyze Mobility status of the Rural Municipality

   The consultant will also have conducted mobility study, incorporated in the O-D survey. This is important especially because the road network in capital has provided access to majority of the population. The question then arises on how efficiently, economically and safely the goods and passengers are transported, which is indicated by mobility.

b. Access the condition of public transportation

   The consultant will have collected data on different public transportation routes and their operation characteristics, which operate within the Rural Municipal area and to other adjoining area.

c. Prepare Rural Municipal Inventory Map (RMIM) of existing roads within Ghyanglekh Rural Municipality.

   The consultant will have prepared the Rural Municipality Inventory Map linking to strategic road networks such as national highways, district core road network, main trails and bridges. This shall be done by walkover surveys using enumerators. The inventory map shall include the road names, total length and breadth of the roads, surface type, existing condition, Right of way, vehicular traffic and pedestrian traffic flow etc.

d. Scoring criteria

The consultant will have developed scoring criteria to screen and prioritize all potential interventions for proper allocation of limited budget. Scoring and prioritization criteria shall be checked with all linkages and interventions and approved by the Rural Municipality.

e. Road classification and Nomenclature

The consultant shall have used metric system of nomenclature and apply the same classification throughout the data collection.

f. Preparation of perspective plan of interventions of services and facilities.

The data collected through accessibility survey, demand survey and inventory maps shall be used to prepare a perspective plan of interventions of services and facilities. All the identified interventions shall be screened and rated on the basis of approved criteria and forwarded to Rural Municipality council meetings. The final perspective plan shall be shown in GIS maps.

g. Prepare a realistic Physical and Financial Implementation Plan of Prioritised Roads for the RMTMP period

The consultant shall have collected information on the resources that can be spent on the construction or rehabilitation of transportation infrastructures by the Rural Municipality. The consultant may also carry out studies to project the resources to fund the transport infrastructures for the next five years. From the total projected resources, the consultant shall discuss with the Rural Municipality to find out the appropriate proportion to be spent on ongoing roads and new interventions proposed. The projected resources should be able to cope with the total number of roads and new interventions proposed.

h. Prepare Rural Municipal Transport Master Plan (RMTMP) of Ghyanglekh Rural Municipality

The consultant shall have prepared Rural Municipal Transport Master Plan (RMTMP) for Ghyanglekh Rural Municipality with due consideration to the existing situation of: vehicular parking, travel routes, modes of transport, etc and propose for future urban

growth. The consultant shall prepare a base scenario of the existing road and transport network and management based on the O-D survey and O-D matrix and prepare road inventory map and transport infrastructure network and management plan based on the travel demand forecast, population growth forecast, and growth rate of vehicular and transport infrastructure.

i. Prepare framework for medium term and long-term planning

The consultant shall also have forecasted the demand for medium term (10 years) and long term (20 years) and recommend a framework to guide future interventions and planning processes. The long-term plan shall consider the proposed East-West Railway and other major transport sector interventions in the long term.

1.4. Approach and Methodology

Roads are supposed to provide both access and mobility to all possible and potential areas. RMTMP will help to assist the planning of such roads to fulfil the stated objectives. Better planning is incomplete without relevant quality data and quality data can only be acquired by use of properly selected survey methods. The chapter deals with the methodological framework adopted for data collection covering all used survey method, sampling techniques, quality and quantity of data along with data processing, analysis and presentation methodology.

a. Approach:

Rural Municipal Transport Master Plan has been prepared using participatory bottom-up approach and differs from conventional practices of trickle-down approach. Techno-Political interface has been incorporated in the planning process, where active participation from representatives of political parties, line agencies, and Rural Municipality officials is crucial. The Rural Municipal Road Coordination Committee (RMRCC) has been constituted as authorized legislative body of Rural Municipality. This body, comprising all political parties' representatives and concerned technical officials, helps in necessary policy decisions during the RMTMP preparation and implementation process.

b. Methodological Framework:

The study started with preliminary planning or desk study where basic background of Rural Municipality is studied with help of secondary data including census data, GIS data. The study got acceleration with formation of RMRCC and inception report. Various field surveys were carried out with objective of collecting primary data on transportation network, trip characteristics and service facilities. Along with the primary data, demands for various transportation projects (construction/upgrading/maintenance) were obtained from each ward. Also, potential areas/locations for various facilities were also identified based on interaction with local people and RMRCC. The scoring criteria for prioritizing road network was identified based on ToR and will be approved by Rural Municipality. Then, the hierarchy of roads will be purposed and perspective plan of various interventions will be purposed and analysed based on available fund and finally physical and financial implementation plan of prioritized roads for RMTMP period. After analysis, the study will come up with potential roads, that need immediate intervention and roads that need to be given consideration for effective future planning.

All the above-mentioned strategy adopted for data collection, processing and analysis is summarized in the following figure in next page.

c. Secondary Data Collection

Any sorts of data that were collected from secondary sources are called secondary data. These data were collected from annual report published by district level offices and consultation with various concerned stakeholders. Rural Municipal Road Coordination Committee (RMRCC), which compromises people from various fields and political parties, is the next source for various secondary data. Field study was also carried out for general socio-economic assessment of the Rural Municipality that includes collection of data regarding high development potential areas such as extensive agriculture, horticulture, livestock farming, high value cash crops, cottage and agro-based industries, centre for business/commerce/markets places, tourism area, service centres (hospital, health post, agriculture service sub-centre etc.). The information about demographic data of Rural Municipality, various maps showing service centres, transport infrastructure inventory, past plans and sector study reports, sector standards and policy targets were collected from the secondary sources, which includes Bureau of Statistics, Survey Department, Local NGOs, line agencies, DDC, Rural Municipality etc. Digitized topographic maps, administrative

map of Rural Municipality, strategic road network map prepared by DoR, etc. were some other secondary data that were used during the study.

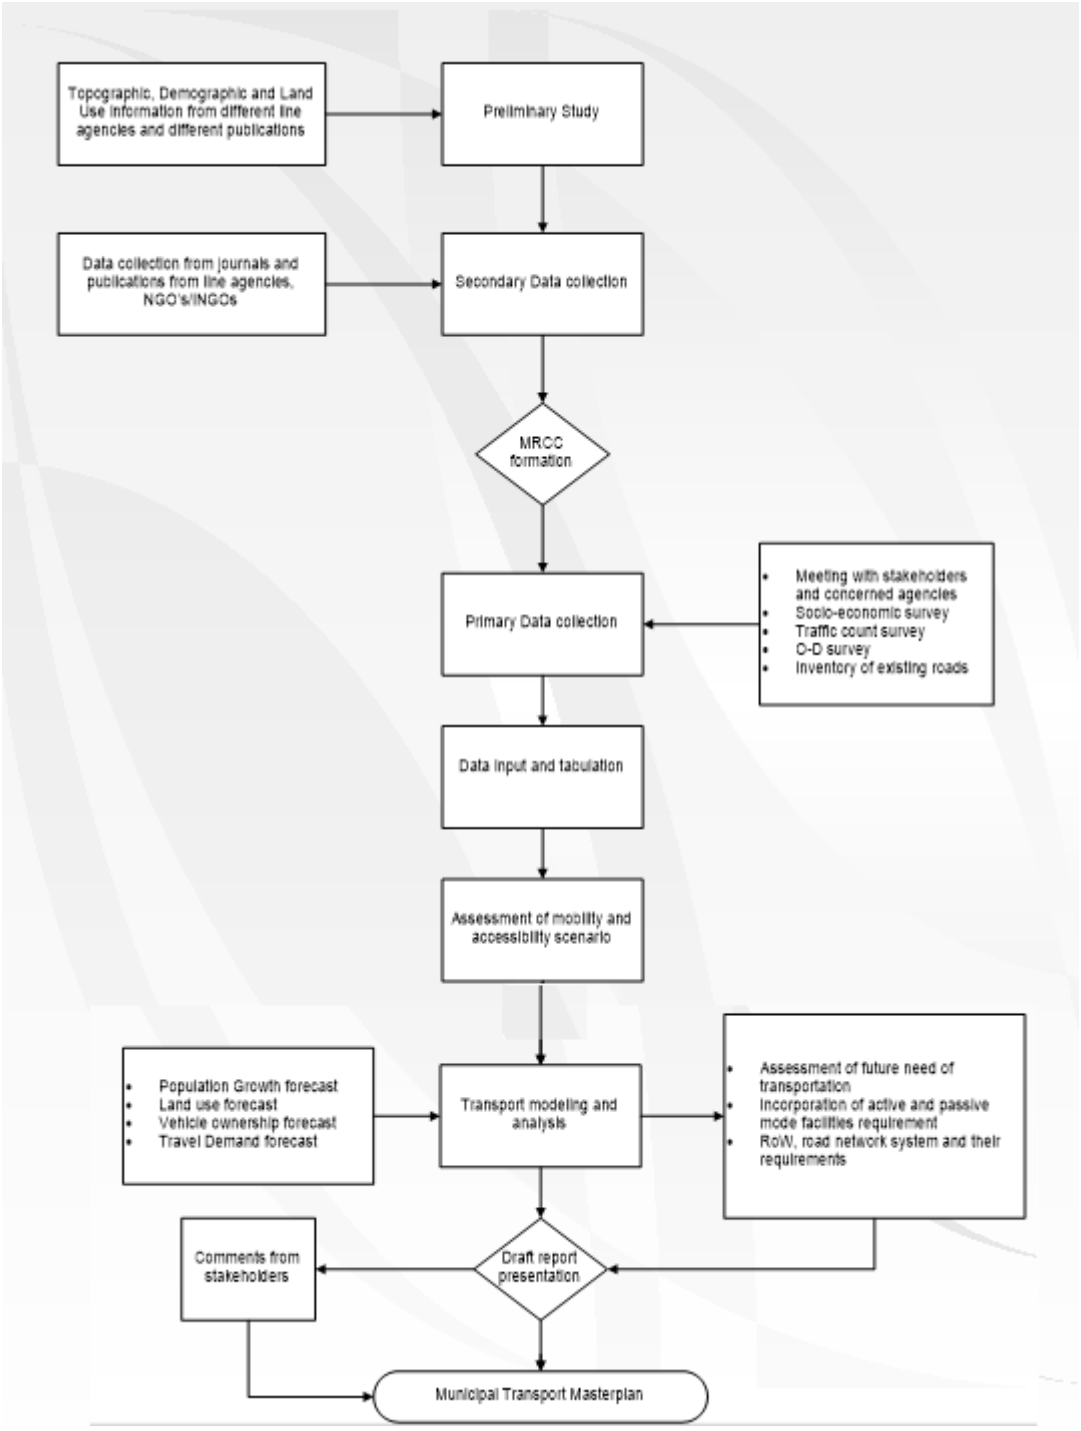

Figure 1: Methodological framework

d. Primary Data Collection:

Primary information on present household and trip characteristics, traffic characteristics, existing accessibility and mobility level of settlements, prioritized road network required for each ward are obtained via various reliable methods. Tracking of the existing road network along with detail information of its width, surface type and possible intervention required for the effectiveness of services is also carried out.

The primary data collection methods carried out in the field was:

- Road Inventory Survey
- Demand Survey
- Public Transport and Services Study

Road inventory survey was conducted to collect data on its condition of road, road linkage, road safety status and issues that need to be highlight. It helps in field validation of base maps and also assists in preparation of road inventory map, nomenclature and coding of the road linkages and to propose various interventions.

Road Demand survey comprised of interaction session with the members of ward committee followed by asking them to fill up demand survey form, which includes demand of new facility or interventions to improve existing roads based on priority.

Public Transport and Services Study highlights the services provided by public transportation and location of various services and facilities. It was carried out by directly interviewing the route operators.

e. Data Processing, Analysis and Presentation of Reports

Data collected at field were first entered at MS office tools (MS Excel and Word) and GIS database. All the complete and reliable sets of data were transformed into useable information and the present scenario of Rural Municipality are shown through maps, graphs, figures and tables. Similarly, those which were entered into GIS database provide various types of maps and tables. Population and traffic data were forecasted for the RMTMP and RMTPP time period. Various transportation models were used for interpretation and forecasting. And, finally various interventions were proposed and their economic analysis was also performed.

f. Scoring Criteria for Prioritization

A network consists of several links. It is not possible to construct all roads at a time due to resource and time constraint. Therefore, each link in a network needs to be prioritized. After developing a Rural Municipal level network, the cost estimate of the road is prepared. Existing population within the zone of influence, present road demand, future potential route, accessibility situation, land use pattern, environmental and social safeguard, proximity to the market/service centres, religious and tourism places were taken as the indicators for prioritization. The scoring criteria will be finalized after rigorous study and approval from Rural Municipality and RRMRCC.

Table 1: Scoring Criteria for prioritization of Rural Municipal road

S.N	Scoring Criteria	Scoring Unit	Score
1	Link providing service to large settlement areas/population	Population served/km	30
2	Link providing service to existing · market center · tourist attraction areas · other obligatory centres as decided by the Rural Municipality	No of areas	20
3	Link providing service to the existing service centres such as health centres, education centres (schools/campuses), offices (Rural Municipality office/Government office, etc.),	Number of different service sector	20
4	Priority of Ward	Ranking of priority from 1 to 5	20
5	Link providing service to the areas recognised by the Rural Municipality as areas for special consideration, such as areas inhabited by backward and poor ethnic groups/communities, isolated remote areas, historic sites, religious sites etc	Connection to the settlement of such criteria	10
Total			100

Chapter 2: Review of Existing Infrastructure Situation

The chapter deals with the present condition and scenario of the Rural Municipality based on various primary and secondary data sources. Socio-economic, trip, land use and transportation characteristics are basically dealt in this chapter along with analysing accessibility and mobility scenario within the Rural Municipality. The basic data source of the analysis is the collected primary data.

2.1 Location

Ghyanglekh Rural Municipality lies in Sindhuli district of Bagmati Province. Topographically the Rural Municipality entails from 27°16'44"N to 27°24'45"N latitude and from 85°41'01"E to 85°54'18"E longitude with the elevation ranging upto 2100 m. This Rural Municipality lies in the Northeastern part of Sindhuli District.

Table 2 Borders of Ghyanglekh Rural Municipality

East:	Kamalamai Municipality
West:	Kavrepalanchowk District
North:	Sunkoshi Rural Municipality
South:	Marin Rural Municipality & Kamalamai Municipality

This Rural Municipality is surrounded by four Rural Municipalities and one Municipality. Kamalamai Municipality lies in East, Sunkoshi Rural Municipality lies in North, Kavrepalanchowk district lies in West, and Kamalamai Municipality and Marin Rural Municipality lie in South of Ghyanglekh Rural Municipality.

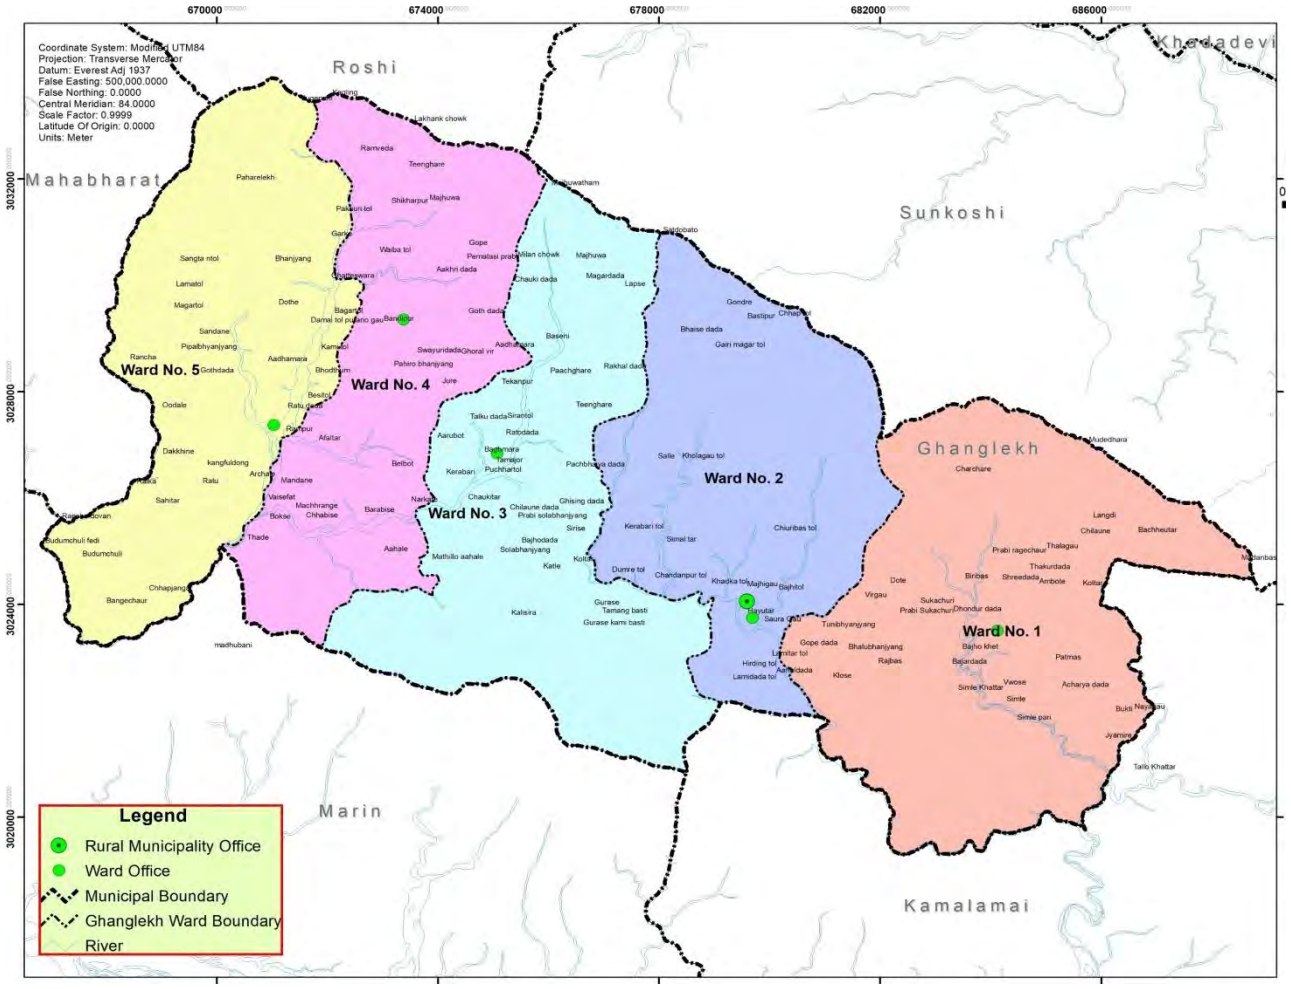

Figure 2 Ward Map of Ghyanglekh Rural Municipality

2.2 Administrative Division

In 12 March 2017, the government of Nepal implemented a new local administrative structure consisting of 753 local units. With this implementation of the new local administrative structure, VDCs have been replaced with the Rural Municipal and Rural Municipal councils.

The Ghyanglekh Rural Municipality was established by merging the Amale (1-9), Bastipur (1-9), Tamajor (1-9), Netrakali (1-9) and Shanteshwori (1-9) Village Development Committees (VDCs) having a total area of 166.77 sq. kms. After merging the five VDCs' population it had a total population of 13,661 according to 2011 Nepal census. At present, the population of Ghyanglekh is 17,261. The population density of Ghyanglekh Rural Municipality is 103.5 person/sq.km. Ghyanglekh Rural Municipality has altogether 5 wards.

Table 3 Formation of wards of Ghyanglekh Rural Municipality

S. No	Ward No	Previous VDC
1	**1**	Amale (1-9)
2	**2**	Bastipur (1-9)
3	**3**	Tamajor (1-9)
4	**4**	Netrakali (1-9)
5	**5**	Shanteshwori (1-9)

Source: MoFAGA, Nepal

2.3 Socio-Demographic Condition

According to Village Profile, population of this Rural Municipality as of 2077BS is 17,261. The overall sex ratio of this Rural Municipality is 1.13 female per male. The population is composed of varieties of ethnic groups. Out of 17,261 population, 12,843 people are of Tamang ethnic group (74.40%), 1,384 people are of Magar ethnic group (8.02%), 1,101 people are of Newar ethnic group (6.38%) and the remaining 11.2% of population is comprised of various caste groups like Bishwokarma, Chhettri, Sunuwar, Thami, Pariyar, etc.

The table below illustrates the wardwise population of this Rural Municipality.

Ward num.	Population (as of 2077 count)
1	2,054
2	3,777
3	3,009
4	4,753
5	3,668
Total	**17,261**

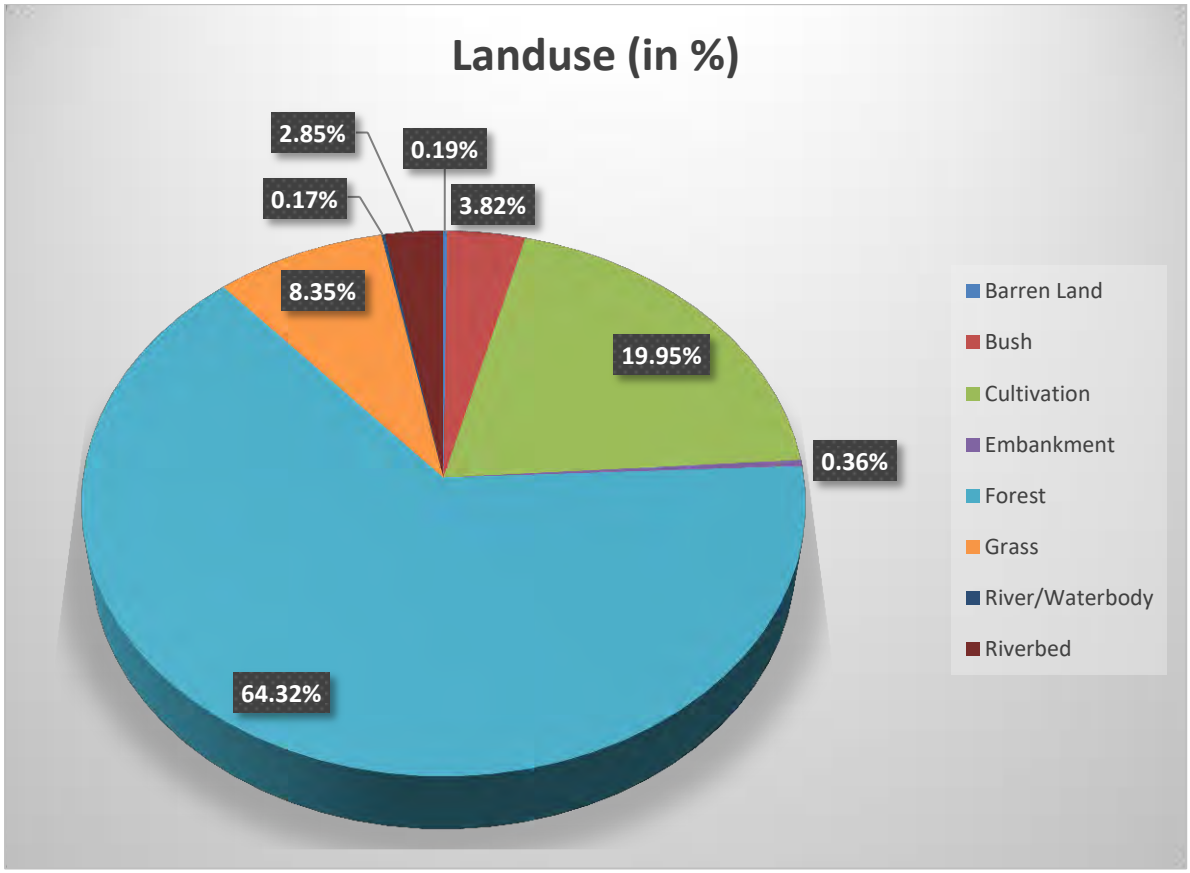
The population density of this Rural Municipality is 103.5 person per square kilometer.

2.4 Land Cover

This Rural Municipality lies in the hilly region of Nepal. Most of the area is covered by forest, cultivation land and grasses. More than half of the area is covered by Forest Areas whereas barren land, pond/lake, River/water body and others cover negligible portion of this Rural Municipality.

Table 4 Land use condition in the study area

S.N	Landuse	Area Covered (Sq. Km)	Percentage Covered
1	Barren Land	0.32	0.19%
2	Bush	6.36	3.82%
3	Cultivation	33.27	19.95%
4	Embankment	0.60	0.36%
5	Forest	107.26	64.32%
6	Grass	13.93	8.35%
8	River/Waterbody	0.28	0.17%
9	Riverbed	4.75	2.85%
Grand Total		**166.77**	**100.00%**



2.5 Transportation

a. Road inventory

For the collection of existing road infrastructure data, GPS survey was used and total length of road surveyed was **316.55 Km**. Based on field survey, ward no 4 has highest length of road and ward no 2 has smallest road length among all wards.

Table 5: Existing Road condition based on Surface Type

Wards	Road Surface/Approx. Length (Km)			
	Concrete	Earthen	Gravelled	Grand Total
Ward 01	0.05	58.62	11.99	70.66
Ward 02	0.03	45.39	5.25	50.67
Ward 03	-	55.04	2.59	57.62
Ward 04	-	72.61	-	72.61
Ward 05	-	64.98	-	64.98
Grand Total	**0.09**	**296.64**	**19.83**	**316.55**

The road inventory including new track is given below:

Table 6: **Existing Road condition based on Surface Type with New Tracks**

Wards	Road Surface/Approx. Length (Km)				
	Concrete	Earthen	Gravelled	New Track	Grand Total
Ward 01	0.05	58.62	11.99	34.19	104.85
Ward 02	0.03	45.39	5.25	11.93	62.60
Ward 03	-	55.04	2.59	23.35	80.97
Ward 04	-	72.61	-	26.12	98.73
Ward 05	-	64.98	-	28.01	92.98
Grand Total	**0.09**	**296.64**	**19.83**	**123.59**	**440.14**

Based on the data collected, it can be seen that the road density per 1000 population is 23.17km per 1000 population and 1.90 km per square kilometre of area. This value is high as compared to national statistics such as 1.91 km per 1000 populations and 0.344 km per square kilometre.

Table 7: Road Density ward wise

Ward No.	Population	Area (Sq. Km)	Road (In Km)	Road Per Sq. Km	Road per 1000 Population
1	2,261	40.96	70.66	1.73	31.25
2	3,029	30.07	50.67	1.69	16.73
3	2,246	35.51	57.62	1.62	25.66
4	3,400	28.52	72.61	2.55	21.36
5	2,725	31.71	64.98	2.05	23.84
Total	**13,661**	**166.77**	**316.55**	**1.90**	**23.17**

In this road inventory survey, it was found that the roads of this Rural Municipality are narrow and their width is insufficient to cross two vehicles from opposite direction at a time. Also, the actual width of feeder road and district roads is very small in comparison to their right of way.

According to the District Transport Master Plan (DTMP) of Sindhuli District, Two road of total length **51.27 KM** of this Rural Municipality is listed as district road core networks (DRCN).

Table 8: District Road Core Networks inside Ghyanglekh Rural Municipality

S.N	Code No.	Road Name	Approx. Length (Km)		Total	Surface Type	Remarks
			Earthen	Gravelled			
1	**20DR004**	Kapilakot Madhubani Rampur Netrakali Kusheshwor Dumja Sadak	26.37	-	26.37	Earthen	DRCN
2	**20DR005**	Pipalbhanjyang Hayutar Netrakali (Belbot) Sadak	5.07	19.83	24.90	Earthen/ Gravelled	DRCN
Grand Total			**31.44**	**19.83**	**51.27**		

These District Roads were under the responsibility of the District Development Committee and now they are under the responsibility of Rural Municipality itself.

a. Bridge/Crossings

This Rural Municipality consists of steep hills and fast flowing streams. Travelling across such geographical surface requires large number of bridges and crossings. Currently, 1 motorable bridge is under construction.

S.N	Existing Cross Drainage Structures	Number
1	**Bridge**	1*
2	**Culvert**	7
3	**Causeway**	9
Total		**17**

b. Road Priority

From the ward level workshop, the most demanding five roads for each ward are collected and these roads will be used for the road priority and while developing road hierarchy.

Table 10: Road Priority ward wise

Wards	Priority/Approx. Length (Kms)					
	1	**2**	**3**	**4**	**5**	**Total**
Ward 01	16.43	7.76	12.13	3.09	7.02	46.44
Ward 02	12.19	6.41	2.63	3.53	3.75	28.51
Ward 03	3.75	13.06	5.07	5.34	3.94	31.15
Ward 04	16.08	5.40	5.54	4.78	5.73	37.54

c. Traffic Condition

This Rural Municipality possesses mixed traffic. There is some amount of traffic volume on roads connecting Rural Municipality office and Sindhuli. Nevertheless, the traffic on other Rural Municipal roads is negligible. Public transportation is available from Hayutar and Rampur which provide mobility to local people. However, these means of transportation are not reliable due to poor road infrastructures inside the Rural Municipality. For the goods transportation purposes, large and small trucks are being used along with public Jeeps, and for the transportation of construction materials such as sand, stone and gravel, tractors and trippers are being used.

2.6 Public Transportation

Public transport is a shared passenger transport service, which is available for use by anyone who pays the set fares. It generally operates on fixed routes and may include modes such as three-wheelers, mini/micro buses, buses, trolley buses, trams, trains and ferries. Besides reducing congestion and air pollution by providing transportation services to a large number of people, high capacity public transport systems may also influence the urban form and quality of life in cities. While in areas, public transportation mainly deals with providing accessibility, transport of construction materials and goods and linkage with nearest urban area. A good public transport system provides efficient and affordable mobility, and access to work, school/colleges, social, recreation and economic activities.

a. Passenger Movement

Public transportation is inevitable need in today's world. Development of a region cannot be effective and efficient without proper public transportation system. Urban public transportation generally deals with cost effectiveness, time saving and comfort of travel. However, public transportation services more broadly support well-being for residents by also providing

transportation to employment, schools, places of worship, and social and recreational destinations. Access to public transportation in areas is limited by travel times and distances, frequency of service, cost, and limitations in funding to address these challenges.

Figure 3: Public Vehicles inside Rural Municipality

Generally, two types of trips are generated inside this Rural Municipality. First one is trips made from Rural Municipality to nearest cities and finally to capital city- Kathmandu. Second types of trips are intra Rural Municipal trips destined to Rural Municipality center or ward centers. For first kind of trips, public vehicles are available from Hayutar and Rampur. There is no any managed buspark in this Rural Municipality. And open spaces are used as the temporary bus stations in this Rural Municipality. In some wards, people must walk to reach their desired destination due to lack of public vehicles.

b. Freight Transportation

Freight transport is the physical process of transporting commodities and merchandise goods and cargo. In past, people of areas of Nepal used to be independent in basic life requirements. However, with an increase of technology and accessibility, import and export has increased significantly in Rural Municipality. People are now dependent on imported goods for day-to-day life operation. Majority of goods being imported in this Rural Municipality are daily consumption materials—food, clothes, stationary and so on—and construction materials. Generally, goods for daily used are imported from Sindhuli and Ramechhap. Materials for construction materials are also imported from Sindhuli, Ramechhap, etc.

At the beginning, transportation of goods used to be carried by people themselves, which was expensive and tedious process. Transportation through such methods was only possible for people with high purchasing power. Later on, people started using animals as a means of goods of transportation. Mules are still used in areas of Nepal for transportation of goods. This decreased

transportation cost and time of travel and in the meantime, this increased access of general public to imported goods. This significantly increased dependency of people on imported goods. After 90's, road network reached in almost every part of country which significantly increased movement of goods inside country. Nowadays, trucks, pick-up vans are used to transport goods and tippers are mainly used to transport construction materials.

2.7 Travel Pattern and Characteristics

Majority of trips generated are directed towards Hayutar and Rampur, then to Sindhuli Bazar or Khurkot, and subsequently towards Kathmandu. The major routes opted by the people to get in and out of Ghyanglekh RM are: Hayutar – Pipalbhanjyang – Khurkot/Sindhuli – Kathmandu; Rampur – Mahabharat RM – Kavre; and Netrakali – Bandipur – Banepa. People travel to Sindhuli Bazar, Khurkot and Kathmandu in search of employment opportunities, better health care, and better educational facilities. Inside Rural Municipality, majority of trips are directed towards Hayutar, Netrakali, Chaukitar and Rampur and other small market centres.

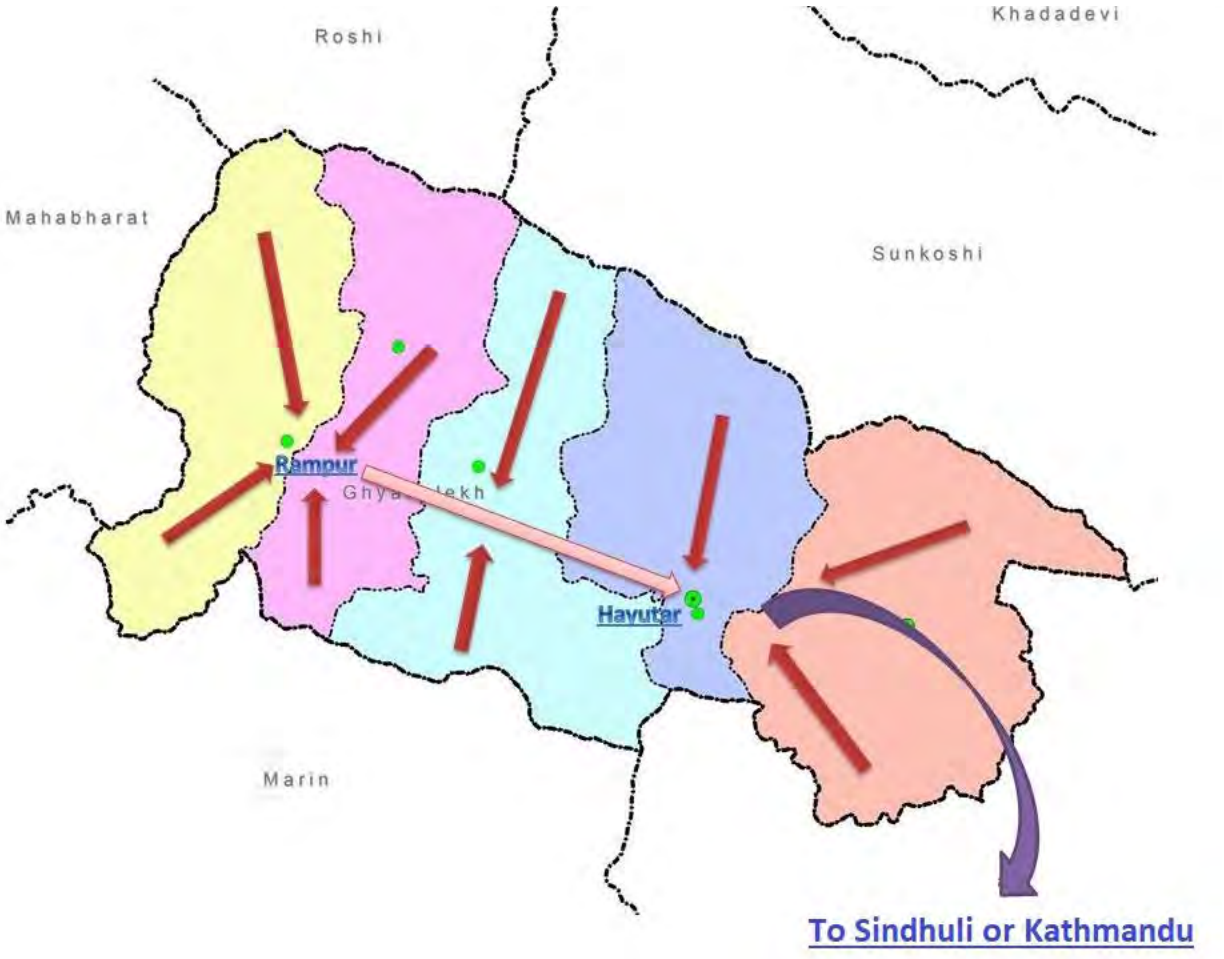

Figure 4: Showing Travel Pattern of Ghyanglekh

2.8 Transport Infrastructure Connectivity

The Ghyanglekh Rural Municipality is located in the Bagmati Province but currently, the traveling route is unnecessarily long. This rural municipality is connected to other parts if the country through road networks only. Hayutar, Ghyanglekh is at a distance of 22 kms from Pipal Bhanjyang on BP Highway, 35 kms from district headquarters Sindhuli Bazar and 158 kms from Kathmandu. The major routes opted by the people to get in and out of Ghyanglekh RM are: Hayutar – Pipalbhanjyang – Khurkot/Sindhuli – Kathmandu; Rampur – Mahabharat RM – Kavre; and Netrakali – Bandipur – Banepa. Buses are operated on the former route as shown in the photo above. The connectivity status is shown in the photo below:

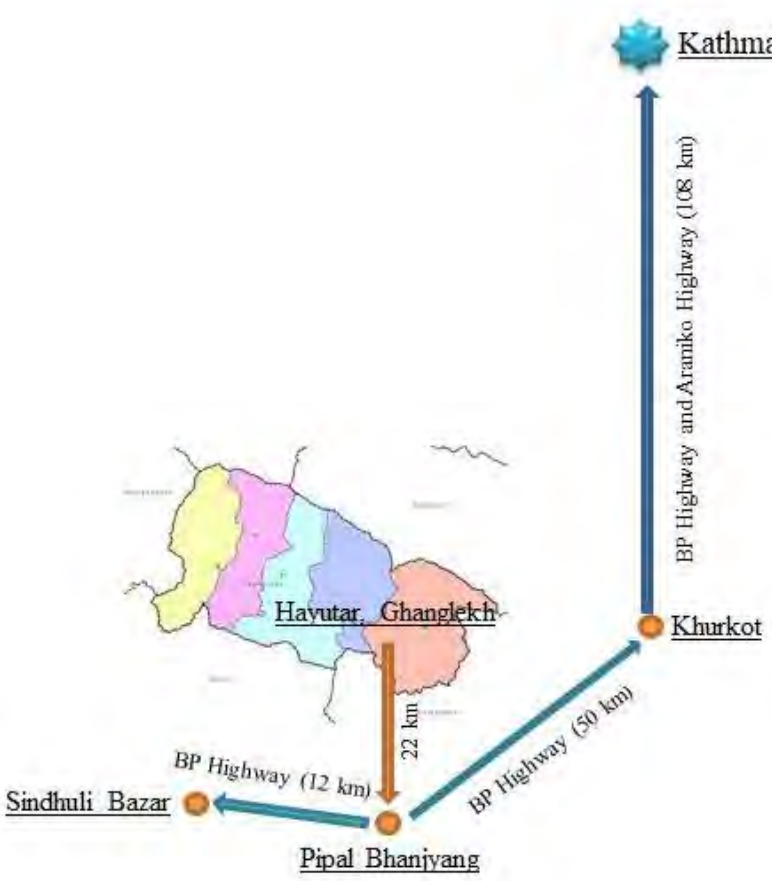

Figure 5: (Illustrative) Connectivity to the Capital City

2.9 Vehicle Ownership Study

People of Ghyanglekh Rural Municipality own various types of vehicles. But the most common vehicle types are: Motorcycle (2 wheeler) and Car/jeep (4-wheeler). The very high number of motorcycles as compared to other vehicle types may be because of the affordability and the flexibility of riding characteristics. The vehicle ownership data is shown as below:

Table 9: Vehicle Ownership Data

The data can be visualized in charts as follows:

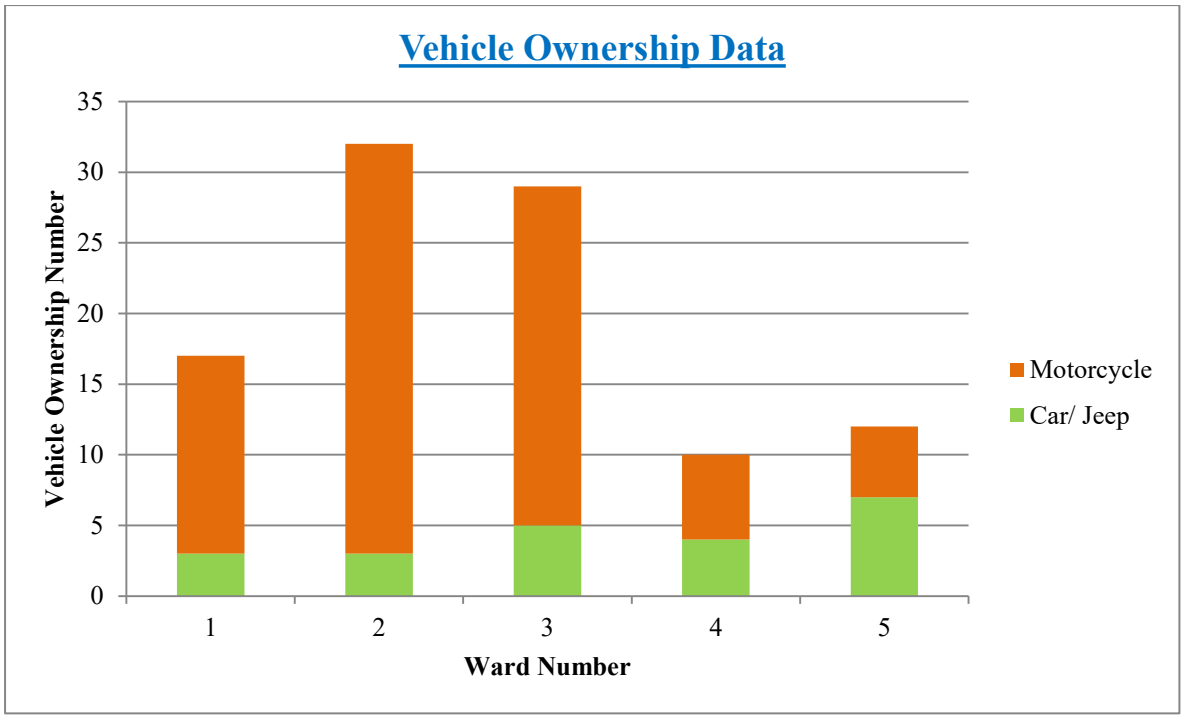

Figure 6: Vehicle Ownership Data

2.10 Road Network Deficiencies

The major deficiencies of road network are as follows:

1. Lack of proper cross drainage structures
2. Narrow and earthen roads
3. Majority of roads fail to provide service during rainy season
4. Slope of roads is too high for smooth operation of vehicle
5. Roads do not interlink between each other for proper operation of public vehicles

2.11 Visionary City Development Plan

The vision of Ghyanglekh Rural Municipality should be to develop an environment friendly and clean Rural Municipality by fostering its cultural and religious history and importance with modern urban facilities. However, this plan is yet to be prepared.

For this, the main visionary city development plan of the Rural Municipalityis to develop/preserve the following:

1. Agriculture
2. Tourism
3. Industry

2.12 Indicative Development Potential

IDP is basically the indication of the existing and potential market center/service centers (key growth centers) and the areas having various development potentials such as agro-based industries, high value cash crops and tourism. Thus, IDP shows high value cash crops, tourism area, and area of service centers such as hospital, post office, telecommunication, school, campus, security offices and large settlements, important historic and religious places. Finally, it prepares the ranking of the markets of the Rural Municipalities the basis of network planning. Existing/potential areas are defined as:

- Existing/potential areas for development of large industries.
- Areas with extensive small cottage industries.

- Area with service centers such as hospital, post office, telecommunication, school, campus, security offices, Bus Park, sport and recreational centers etc.
- Potential areas for tourism development.
- Area with large settlements.
- Area with important historic and religious places.
- Areas with extensive high value cash crops
- Areas with extensive horticulture.
- Areas with extensive livestock farming.

Chapter 3: Hierarchy of Rural Municipality Road Network

3.1 Road Hierarchy

Roadways serve a variety of functions, including but not limited to the provision of direct access to properties, pedestrian and bicycle paths, bus routes and catering for through traffic that is not related to immediate land uses. Many roads serve more than one function and to varying degrees, but it is clear that the mixing of incompatible functions can lead to problems. A road hierarchy is a means of defining each roadway in terms of its function such that appropriate objectives for that roadway can be set and appropriate design criteria can be implemented. These objectives and design criteria are aimed at achieving an efficient road system whereby conflicts between the roadway and the adjacent land use are minimized and the appropriate level of interaction between the roadway and land use is permitted. The road hierarchy can, then, form the basis of ongoing planning and system management aimed at reducing the mixing of incompatible functions.

3.2 Objectives of Road Hierarchy

The key objective of a road hierarchy is to ensure the orderly grouping of roadways in a framework around which state and local governments can plan and implement various construction, maintenance, and management schemes and projects. It should also assist local and state governments with the adoption of appropriate standards for roadway construction.

A well-formed road hierarchy will reduce overall impact of traffic by:

- concentrating longer distance flow onto routes in less sensitive locations;
- ensuring land uses and activities that are incompatible with traffic flow are restricted from routes where traffic movement should predominate;
- preserving areas where through traffic is discouraged;
- Ensuring activities most closely related to frontage development, including social interaction and parking, can be given more space within precincts where environmental and access functions should predominate.
- orderly planning of heavy vehicle and dangerous goods routes;
- planning and provision of public transport routes;
- planning and provision of pedestrian and bicycle routes;

- identifying the effects of development decisions in and on surrounding areas and roadways within the hierarchy;
- development design that facilitates urban design principles such as accessibility, connectivity, efficiency, amenity and safety;
- assigning control over access onto traffic carrying roads to ensure safe and efficient operation for traffic;
- Identifying treatments such as barriers, buffers and landscaping to preserve amenity for adjacent land uses. Thus, in order for road hierarchy to be effective, it needs to be much more than just a map of colored lines. This paper presents road hierarchy principles that can be applied to produce a powerful planning tool.

3.3 Classification of Rural Municipal Road Network

A productive transportation system accompanies an order. The hierarchy of road is dependent upon the function that the street is required to perform, and the kind of movement and the way users present. The outline speeds, way widths and other geometric characteristics are adapted to suit the way work. Based on these guidelines, the road networks inside Rural Municipality are classified in four classes:

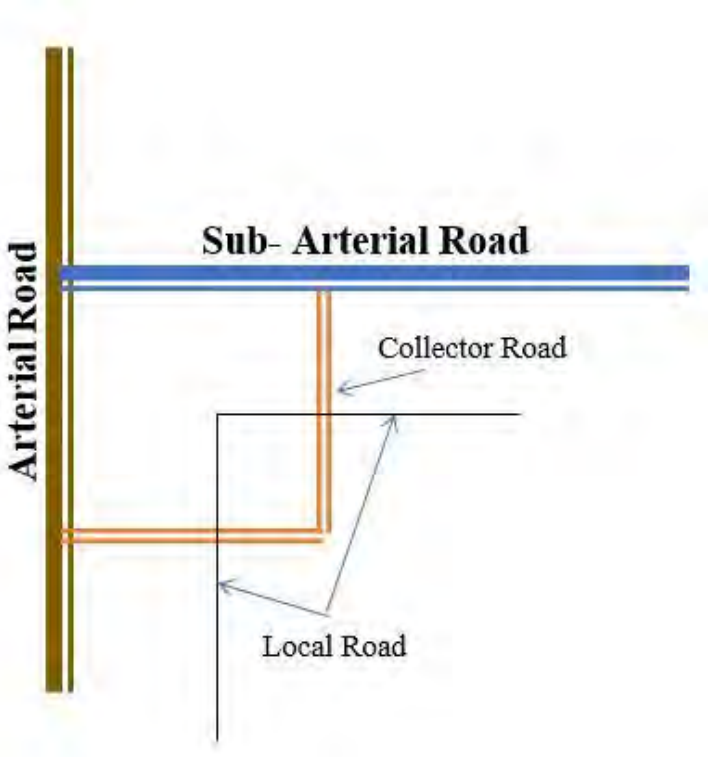

Figure 7: Classification Road

a. Arterial Roads

They are the primary roads & are on top in hierarchy of roads for guaranteeing versatility capacity. They convey the biggest volumes of movement and longest trips in Municipality. These are characterized by through movement with confined access from carriageway to the side. In such cases, unique provisions ought to be acquainted with decrease clash with the through movement. These roads have the most extreme right of way and traffic volume around the four classes.

b. Sub Arterial Roads

This class of road takes after all the capacities of an arterial road and is portrayed by portability, and indulges through movement with confined access from carriageway to the side. It conveys same movement volumes as the arterial roads. Because of its overlapping nature, Sub arterial roads can function as arterials. This is setting particular and is dependent upon the capacity and the area use advancement it passes through.

c. **Distributor/collector Roads**

As the name recommends, these are connector ways which circulate the activity from access lanes to arterial and sub arterial roads. They are portrayed by portability and access just as. They are portrayed by a low speed limit and have a comparatively small ROW. It conveys moderate movement volumes contrasted with the arterial roads. Because of its covering nature, merchant streets can go about as a sub arterial road and as access lanes, contingent on the capacity and the area utilization of the surroundings.

d. Local Roads

These are utilized for access capacities to bordering lands and regions. A greater part of excursions in the area normally begin or end on these streets. They cater to low velocity and have a nominal ROW of 6m. They convey generally lower volumes of movement at low speeds. They are described by access prevalently; they could be utilized for gatherer capacities.

In total, there are roads of length 421.05 Km within the Rural Municipality excluding feeder roads and National Highways, either in planned or existing condition. All the standards set by the Rural Municipality council are assumed not to decrease its ROW whenever these roads fall on the lower class in this RMTMP.

Table 10: Arrangement of Road width

SN	Road Class	Min RoW(m)	Setback(m)	Pavement(m)
1	A	14/20	1.5/3	11/14
2	B	10	1.5	7
3	C	8	1.5	5.5
4	D	6	1.5	3.75

**The ROW of District Road Core Networks (DRCNs) is 20m*

3.4 Rural Municipality Level Arterial Roads (Class A)

All major roads which connect one or more major Growth Centres (market, tourism Centre, industry, etc.) or several Wards with high network coverage, connected directly or through the National Strategic Road Network or district road falls on the road class A. The proposed right of way for this class of road is 14m and greater than 14m which include footpath, greenery, and the carriageway as shown below in the cross section.

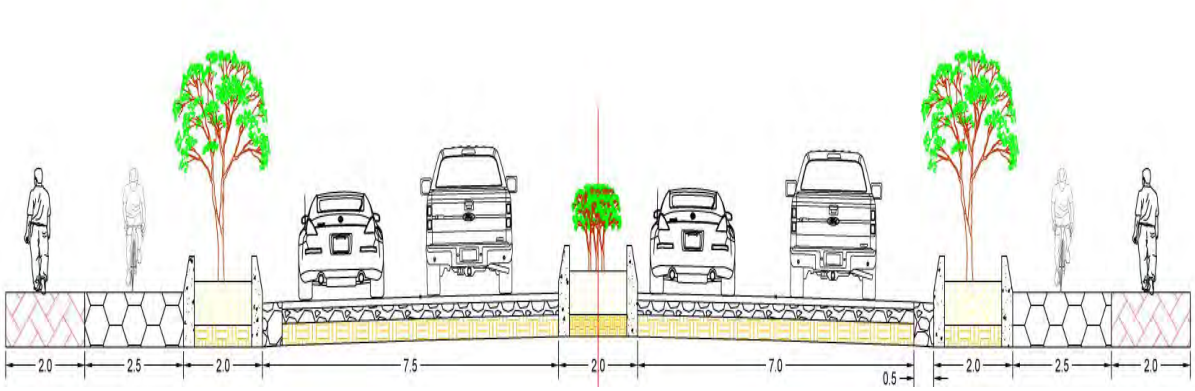

Figure 8: Typical section for Class A road

There are 7 Rural Municipal roads of class A of total length 89.86 Km out of which 82.98 km is existing road and 6.89Km is the new track. Detail of inventory of Class A roads is illustrated in table below:

Table 11: List of Rural Municipality Level Arterial Roads (Class A)

Road Code	Road Name	Approx. Length (Km)			Total
		Earthen	Gravelled	New Track	
A001	Pipalbhanjyang Hayutar Netrakali (Belbot) Sadak	5.07	19.83	-	24.90

Grand Total		**63.15**	**19.83**	**6.89**	**89.86**

3.5 Rural Municipality Level Sub Arterial Roads (Class B)

The municipality level sub-arterial roads function as alternatives for arterial roads. They link arterial roads with collector and distributor roads. All roads which connect to a major road network and other roads of similar hierarchy with a road connecting major Growth Centre of the same or neighboring wards which provide access between Class A and class C road falls on the category of class B. The proposed right of way (ROW) of this class road is 10 m.

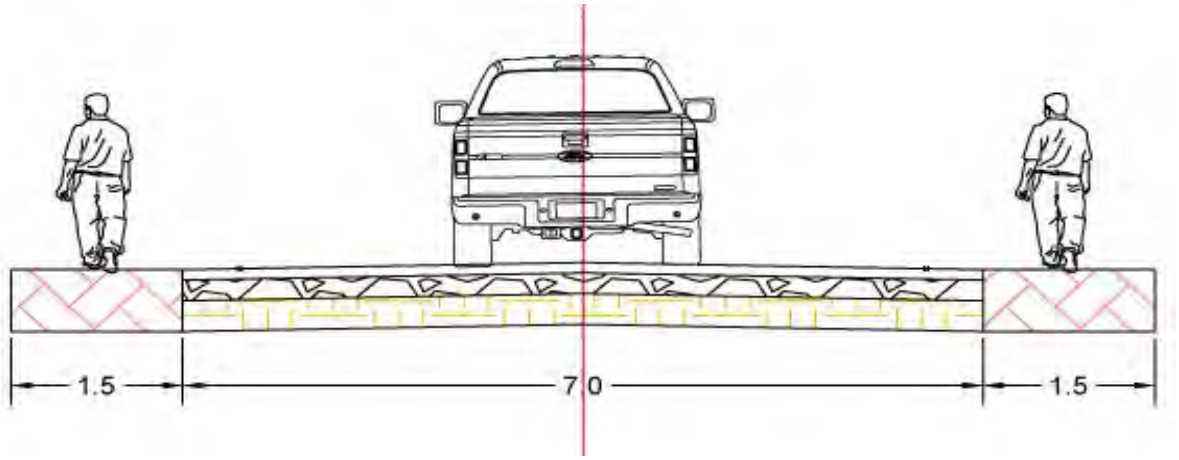

Figure 9 Typical section for Class B road

There are 12 Rural Municipal roads of class B of total length 96.93 Km out of which 78.50 Km is existing road and 18.43 Km is the new track. Detail of inventory of Class B roads is illustrated in table below:

Table 12: List of Rural Municipality Level Sub-Arterialroads (Class B)

3.6 Rural municipality Level Collector Roads (Class C)

All roads which connect to a major road network and other roads of similar hierarchy with a road connecting major Growth Centre of the same or neighboring wards which provide access between Class A and B and class D road falls on the category of class C. The right of way of this class road is 8m.

The following is the list of local roads (Class C). Total length of Class C roads is 56.81 Km, out of which 52.29 Km is existing road with earthen surface and 4.52 Km is the New Track.

3.7 Local Roads (Class D)

All roads which provide connection to higher order roads with all agricultural roads which connect a farm with a mini-market Centre or an agro-based production Centre and means for mobility of local trips are understood as road class D. The proposed right of way for class D roads is 6 m.

The following is the list of local roads (Class D). Total length of Class D roads is 196.54 Km, out of which 102.78 Km is existing road with earthen surface and 93.76 Km is the New Track.

3.9 Rural Municipal Level Ring Roads

The RM council has proposed the development of two ringroads in Ghyanglekh RM. The first one, which is smaller in size is called **Hayutar Ring Road**. The proposed Hayutar Ring Road passes through following places: Lipekhola – Majhigau – Chalise Khola – Hayutar – Lipekhola. The other and larger ringroad that surrounds a large area of Ghyanglekh is called the **Ghyanglekh Ring Road**. The proposed Ghyanglekh Ring Road passes through following places: Tallo Khattar – Simle Khattar – Hayutar – Koltar – Solabhanjyang – Chaukitar – Belbot – Rampur Bazar – Archale – Rancha – Kagling – Lakhank Chowk – Majhuwatham – Satdobato – Mudedhara – Thakurdada – Amale – Patmas – Tallo Khattar. The proposed roads to be comprised in the ringroads are as following:

Table 15: Roads constituting the ring roads

Ring Road	SN	Road Code	Name of Road Link
Hayutar Ring Road	1	**A001**	Pipalbhanjyang Hayutar Netrakali (Belbot) Sadak
	2	**C003**	Lipekhola dalinbhanjyang majhigau hudai chalise samma sadak
Ghyanglekh Ring Road	1	**A001**	Pipalbhanjyang Hayutar Netrakali (Belbot) Sadak
	2	**A003**	Kapilakot Madhubani Rampur bajar hudai Netrakali Kusheshwor Dumja Sadak

	9	**C001**	Amale Dalludada patamas bukti hudai tallo khattar samma sadak

3.10 Summary of Rural Municipal Road Network

Road inventory survey was conducted through the Rural Municipality as far as possible except the new construction considered. In the inventory survey, the surface condition, width of road, and intervention required were collected. These data are presented in Rural Municipality inventory map. Refer annex of this report for map in detail.

Table 16: Length of Roads based on surface condition

Class	Road Surface/Approx. Length (Km)				
	Concrete	Earthen	Gravelled	New Track	Grand Total
A	-	63.15	19.83	6.89	89.86
B	0.05	78.45	-	18.43	96.93
C	-	52.29	-	4.52	56.81
D	0.03	102.75	-	93.76	196.54
Grand Total	**0.09**	**296.64**	**19.83**	**123.59**	**440.14**

Chapter 4: Rural Municipality Transport Perspective Plan

4.1 Vision

To develop effective, reliable and safe transportation system inside Rural Municipality

4.2 Mission

By utilizing internal and external resources, the Rural Municipality will develop effective transportation infrastructures inside Rural Municipality. The Rural Municipality aims to increase economic standard of public by providing access, minimizing travel time and increasing economic activities inside Rural Municipality

4.3 Objectives:

a. To strengthen major road that connects Rural Municipality with other parts of Nepal
b. To strengthen roads that connects ward centers with Rural Municipal centre
c. To develop effective public transportation system inside Rural Municipality
d. To co-ordinate with provincial government and central government to upgrade strategic roads.

4.4 Threats and Opportunities

a. **Threats and Challenges**:

Although Rural Municipality is mainly focused in developing transportation infrastructures, there are some major threats in achieving goal of Rural Municipality. They are as follows:

1. Limited Financial resources: The construction cost of road infrastructures is too high, whereas, the Rural Municipality has limited resources. There is a probability that the Rural Municipality will not be able to generate financial resources for development of transportation infrastructures as expected.
2. Geography: This Rural Municipality possess difficult geographic features. There are many high hills, steep slopes, land filled with rocks and unstable lands. Constructing roads in such difficult terrain is a challenge to this Rural Municipality.

3. Large number of cross drainage structures: This Rural Municipality possess large number of rivulets and streams which need same amount of cross drainage structures. The increase in number of cross drainage structures will significantly increase the construction cost of road.
4. Migration: Although development works are increasing in this Rural Municipality, the inevitable migration of people from this Rural Municipality is increasing day by day. At some point, there might be a situation that Rural Municipality will complete upgradation of road to some settlements whose population has decreased significantly due to migration. If this scenario occurs, then the investment of Rural Municipality will go in vain.
5. Natural Disaster: Certain parts of this Rural Municipality are prone to landslide and debris flow. Such natural disasters might destroy road infrastructures.

b. Opportunities

In addition to above mentioned threats and challenges, there are some opportunities in development of transportation infrastructure for this Rural Municipality.

1. Self-Decision power: The constitution of Nepal has granted self decision-making power to local governments which allows them to deploy funds to whenever and wherever required.
2. Involvement of local people: Since people are interested in development works happening in their locality, Rural Municipality can involve them in development works. That might be through sharing of funding or sharing of labor.
3. This Rural Municipality is supported by B.P Highway, which passes through the vicinity of this Rural Municipality. It plays a major role in mobility and economics of this Rural Municipality.
4. Availability of Construction Materials: For the construction of road infrastructures, construction materials are locally available in this Rural Municipality. This decreases cost of construction.

4.5 Expected Output

The aim of this Rural Municipal Transport Master Plan is to make Rural Municipality prosperous according to vision set by Rural Municipality. While implementing this RMTMP, following outputs are expected in long and short run:

S. No	Particulars	Unit	Expected Output		
			Base Year 2077/78	Short Term (5 Years)	Long Term (20 Years)
1	Total Length of Road	Km	316.55	440.14	440.14
2	Length of Blacktopped Road	Km	-	60.00	440.14
3	Length of Gravelled Road	Km	19.83	100.00	-
4	Length of Unpaved Road	Km	296.72	280.14	-
5	Road Density	Km/ Sq. Km	1.90	2.64	2.64
6	Road Density	Km/1000 Population	23.17	32.22	32.22
7	No of Motorable Bridges	Nos.	1*	6	21
8	No of Culverts	Nos.	7	30	72
	No of Causeways	Nos.	9	12	14
9	Periodic Maintenance	Km	19.83	160.00	440.14
10	Routine Maintenance	Km	316.55	440.14	440.14
11	Buspark	Nos.	-	1	1
12	Bus Stands	Nos.	-	2	5
13	Helipad	Nos.	-	3	5

Note: *Under Construction

4.6 Data Sources

a. Rural Municipality (Office of the Municipal Executive)

The following data were provided by Rural Municipality

1. Budget of Rural Municipality for Fiscal Year 2077/78
2. Policies and Programs of Rural Municipality
3. Central government and Province government plans overarching in Rural Municipality
4. Existing Road conditions of Rural Municipality
5. Contact details of ward level authorities
6. Information about wards, settlements, routes to reach ward centres

b. Ward-level Office

The following data were provided by Wards of Rural Municipality

1. Number of roads inside ward
2. Tole committees of ward
3. Traffic conditions inside ward,
4. Social organizations/institutions inside ward

c. People of Rural Municipality

Following data was obtained from people of Rural Municipality:

1. Name of each road
2. Population and settlement served by each road
3. Existing width and surface condition of each road
4. Problems faced in transportation sector
5. New tracks that are required to be opened
6. Projects and Plans they are expecting from this RMTMP

4.7 Community Engagement and Consultation

Community engagement was a priority during development of the Rural Municipal Transport Master Plan. Public consultation is also a key component of the Rural Municipal road classification process. For a project to be successful, it must ensure that the appropriate review agencies,Rural Municipal bodies, the public and interested stakeholders are given the opportunity to provide their input in a meaningful way at key points in the study process, ensuring that community issues, needs and priorities are addressed and considered. Both focused and broad consultation activities were used to ensure effective communication throughout the RMTMP development process.

a. Rural Municipal Workshop

Different workshop at Rural Municipality was conducted to seek valuable support and organizational expertise regarding compliance issues and other concerns from the respective jurisdictions. Rural Municipal level workshop with the elected members of Rural Municipality, staffs and other stakeholders occurred at appropriate times throughout the project to ensure no complications arose at the time of approval. One Rural Municipal level workshop was conducted throughout this project.

1. Orientation Workshop

Orientation workshop was held on 20th of Magh, 2077 in the afternoon from 11:00 am to 1:00 Pm. This workshop was conducted to provide information about RMTMP, its procedure, significance and set up long-term and short-term goal. Approximately 24 people attended orientation workshop and provided their valuable suggestions and support to this RMTMP.

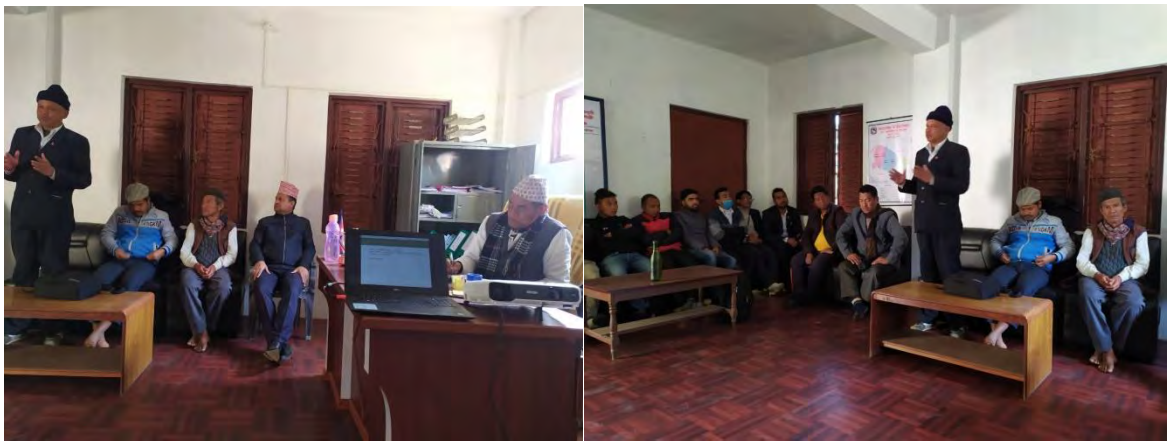

Figure 10: Orientation Workshop

b. Ward Level Workshops

Ward level workshops were conducted to collect existing transportation infrastructure data, view of general public regarding RMTMP and expectations of public from Rural Municipality. This workshop was conducted in all wards in presence of ward presidents, related stakeholders and representatives of consultant. The date and time of ward level workshops are as follows:

S. No.	Ward No.	Date of Workshop	Time	Location
1	1	2077/10/24	01:30 PM to 04:00 PM	Ward Office
2	2	2077/10/20	01:30 PM to 3: 00 PM	Ward Office
3	3	2077/10/23	02:00 PM to 05: 00 PM	Ward Office
4	4	2077/10/22	01:00 PM to 3:30 PM	Ward Office
5	5	2077/10/21	12:30 PM to 3:00 PM	Ward Office

People of this rural municipality enthusiastically involved in those workshops and put forward their problems and needs regarding transportation. In average, 15 people attended ward level workshops. This workshop also decided the Right of Way (RoW) and priority of roads of each ward.

Figure 11: Ward Level Workshop

4.8 Scoring system for screening, grading and prioritization

As the financial resources of Rural Municipality is less as compared to the demand of people there is always conflict among the leaders from different parts for the development of road infrastructure. For this we have to prioritize roads, based on the certain conditions. For this RMTMP, we have adopted the criteria given by the ministry with discussion and minor modification with the concerned stakeholders. Based on these criteria, Rural Municipal and ward roads have been prioritized class wise. The details of prioritization criteria are included in chapter 1 of this report and prioritized roads are shown in Annex with detail of score on each criteria and ranking.

4.9 Possible inter-Rural Municipality/district linkages

According to the District Transport Master Plan (DTMP) of Sindhuli District, two roads of this Rural Municipality are listed as district road core networks (DRCN). Similarly, almost all Rural Municipality level Arterial Roads connect this Rural Municipality with other Rural Municipality. These roads serve as inter-Rural Municipality and district linkages.

4.10 Public Transportation

With the increase of development of infrastructures within the Rural Municipality, the requirement for intra-Rural Municipal public transportation has become mandatory. Although all of these public transportation routes are oriented towards Sindhuli Bazar, they provide significant support to intra-Rural Municipality movement. However, Rural Municipality will require more concrete, effective and efficient public transportation system inside the Rural Municipality in future. To meet this inevitable need, existing public transportation routes should be modified and strengthen while other new routes are assigned based on population, area, expected traffic flow in future and need of local peoples. Such routes are classified in two categories: Primary Transportation Route and Secondary Transportation Route.

Primary Transportation Route:

1. Pipalbhanjyang-Simle-Hayutar-Chaukitar-Belbot-Rampur
2. Kapilakot-Madhubani-Rampur-Belbot-Bandipur-Dumja
3. Rosi Gaapaa-Pakhurefedi-Thakurthan-Rampur-Archale-Ratu-Rancha-Mahabharat GaaPaa
4. Jugepani-Lakhankchowk-Satdobato-Mudedhara-Madanbas

Secondary Transportation Route

1. Tallo Khattar-Patamas-Amale-Simle Khattar-Tallo Khattar
2. Simle Khattar-Amale-Thakurdada-Mudedhara
3. Chandanpur-Salle-Satdobato-Lapse-Rakhal dada-Solabhanjyang-Chandanpur
4. Rampur-Archale-Pipalbhanjyang-Jugepani-Ramveda-Majhuwa-Aakhridada-Bandipur-Gothdada-Aadhamara-Tamajor-Chaukitar-Belbot-Rampur
5. Lipekhola-Majhigau-Challisekhola-Hayutar-Lipekhola (Hayutar Ring Road)

4.11 Road Crashes and Safety Measures

a. Road Crashes

Road crash stands as a major killer in Nepal. On an average, 1,800 people die in road crashes across the country every year. Many crashes go unreported mainly because the parties involved settle the matter themselves. Crashes with minor injury or damage to vehicles are often settled at the crash site and are not reported to police. Only crashes causing human injury are reported.

Figure 12: Road accident near Dhading, which caused 31 casualties (Left), Road Accident in Madi Khola, Pyuthan, causing 18 casualties.

Nearly 75 per cent of the crashes are attributed to negligence of drivers. In 2016-17 drivers' negligence caused 7,487 road crashes out of which 1,392 were due to speeding, 288 due to drink driving, 376 due to recklessness of passengers, 213 while overtaking vehicles, 149 because of mechanical failure, 33 overload, 31 stray cattle, 94 poor road condition and 15 bad weather.

Figure 13: Overloaded vehicle

Source: The Kathmandu Post

According to the Ministry of Health, road crash (7 per cent) is the fourth leading cause of death after infectious diseases, child and maternal mortality (42 per cent), cardiovascular diseases (25 per cent) and cancer (11 per cent) in Nepal.

b. Safety Measures

The basic strategy of a Safe System approach is to ensure that in the event of a crash, the impact energies remain below the threshold likely to produce either death or serious injury. This threshold

will vary from crash scenario to crash scenario, depending upon the level of protection offered to the road users involved. Five pillars have been identified to reduce the risk of crashes inside Rural Municipality.

i. Road Safety Management

The first and foremost step to reduce the risk of crashes is to formulate and implement road safety measures. Government of Nepal has formulated several rules and regulations regarding traffic operations and safety. The Rural Municipality should implement those rules inside Rural Municipality so as to reduce the loss of life and property. Similarly, the Rural Municipality should train related stakeholders about traffic safety, rules, regulations and acts regarding traffic operations.

ii. Safe Road and Mobility

The road infrastructures and mobility of vehicles should be safe so as to reduce the risk of crashes. The construction of roads should be followed by provision of roadside safety structures. Implementation of this procedure must begin from arterial roads and gradually should cover all roads inside Rural Municipality. Roadside safety can be increased significantly by applying some common and cost-effective safety measures.

i. Bio- Engineering

Though roads serve as lifelines for many communities, they also cause environmental degradation in the forms of erosion, shallow landslides, and river sedimentation. As a solution, “eco-safe roads,” or those that incorporate soil bioengineering techniques to minimise negative environmental impacts, can significantly reduce economic losses and environmental degradation, and even enhance local livelihoods.

Figure 14: Bio-Engineering Works

ii. Traffic Signs

Each of Arterial Roads and Major Market/Places need traffic safety signs for both the motorist and the people who are using the same roadways. Bright, eye-catching signs are a must because people are moving rapidly by them and they only have a few seconds on average to read and comprehend them. They should also be very clear and easy for everyone to understand. These traffic safety signs have the potential to save lives and reduce accidents.

Figure 15: Traffic Signs

iii. Road Marking

Installing road markings in visible and understandable condition is vital for road safety. They help road users to navigate the road systems, making us aware of upcoming hazards and of key bits of information to help us drive appropriately for the situation. The reliance on these features cannot be exaggerated, and without their clarity, it can cause confusion on the roads. Road markings are especially important at nighttime when, in the dark conditions, we rely on their presence even more so.

Figure 16: Road Markings on Narayanghat-Muglin Road

Source: Nagariknews

iv. Traffic Calming

Physical obstructions meant to slow down and possibly divert vehicles in residential areas are called traffic calming devices. More generally, it can be referred as changing a road in an attempt to lower vehicle speeds, reduce traffic volumes, divert cut-through traffic, or some combination therein.

Some Traffic Calming Measures

1	Angled Slow Points	12	Raised Crosswalks
2	Center Islands	13	Raised Intersections
3	Chicanes	14	Realigned Intersections
4	Chokers	15	Reduced Intersection Turning Radius
5	Diverters/Diagonal Barriers	16	Roundabouts

6	Full Closures	17	Speed Humps
7	Half Closures	18	Speed Tables
8	Intersection Neckdowns	19	Striped Bicycle Lanes to Narrow the Drive Lanes
9	Mid-Block Bulb-Outs	20	Textured Pavement
10	Median Barriers	21	Traffic Circles
11	Neckdowns	22	

Figure 17: Traffic Calming Using: Speed Bump (left), Obstacles (Right)

v. Bus Bays

A branch from or widening of a road that permits buses to stop, without obstructing traffic, while laying over or while passengers board and alight; also known as a blister, duckout, turnout, pullout, pull-off or lay-by.

Figure 18: Bus Bay

Photo: NTA, Ireland

iii. Safe Vehicles

Another important factor to reduce traffic crashes is to make vehicles safe and sound. The vehicles operating inside Rural Municipality should be as per standard set by Government of Nepal. Similarly, Rural Municipality should start route provision procedure to operate public vehicles inside and to/from Rural Municipality. Similarly, Rural Municipality should provide basic incentives to promote in-vehicles safety features, provide basic vehicle repair and maintenance trainings. Likewise, Rural Municipality should investigate crashes occurred and implement the recommendation of investigation.

Figure 19: Pollution Caused by Old vehicles

iv. Safe Road Users

To reduce road crashes, road users must be safe themselves. Rural Municipality should strictly implement the provision of using seatbelts, and helmets while driving. Similarly, the Rural Municipality should conduct awareness campaign to provide knowledge about proper use of road infrastructures. Similarly, driving license must be made compulsory for driving. Likewise, there must be provision of driving training centres and capacity enhancement.

v. Post-Crash Response

Although we can minimize traffic crashes, we can not totally abolish road crashes. For this reason, we should prepare for quick post-crash response to reduce the effect of crashes. For quick rescue in case of a crash, the Rural Municipality should have provision of:

- Toll-Free number for emergencies
- Ambulance facility
- Primary treatment facility within 30 minutes
- Necessary fund to aid victims of accidents
- Alternative routes for mobility

Chapter 5: Capital Programming

4.1 Timing and Priorities

To help guide the Rural Municipality in implementing the infrastructure plans recommended in the RMTMP, a suggested timing for projects has been developed based on a technical assessment that considered a number of key elements, such as, capacity needs, connectivity and compatibility with other Rural Municipal objectives and plans. The table below presents a summary of the recommended mid to long term roadway improvements and the estimated timetable for their implementation. The plan focuses on improvements of major Rural Municipal roads, accessibility to services and connectivity to other parts of country.

Urban Development Strategy 2015 aims to pave 50% of the Rural Municipal roads by the end of 2031AD for New Rural Municipalities and this RMTMP has planned to pave **all roads** within the perspective period of 20 years i.e. by the year of 2041AD in its **full width**.

The timing for the improvements shown in table in below has been based on the results of the transportation analysis and a staging of the works to balance the financial impact over time.

Table 17: Timing and Priorities of Programs

S. No.	Plan	Year	Term	Improvement Type
1	Upgrading Road Connecting Rural Municipal Office	2021-2023	Immediate	Gravelling
2	Upgrading Road Connecting ward Office	2021-2023	Immediate	Gravelling
3	Upgrading Road Connecting Rural Municipal Office	2023-2026	Short Term	Blacktopping
4	Upgrading Road Connecting ward Office	2023-2026	Short Term	Blacktopping
5	Construction of at least two helipads	2021-2026	Short Term	New Construction
6	Upgrading tracks connecting all settlements	2023-2031	Mid-Term	Gravelling
7	Upgrading tracks connecting all settlements	2026-2031	Mid-Term	Blacktopping
8	Upgrading Class A and B roads to full extent	2031-2041	Long- Term	Widening/Blacktopping
9	Construction of helipad in all ward centres	2031-2041	Long- Term	New Construction
10	Construction of Bus Park with terminal	2031-2041	Long- Term	New Construction

4.2 Financial Analysis

The Rural Municipality should continue to monitor available provincial and federal funding programs to establish if any of the recommended improvements identified in this RMTMP will be eligible. Ultimately, the most reliable and consistent sources of funding for transportation system improvements will be the annual development budget of Rural Municipality.

For the financial requirement, the rate of different interventions as given by the ToR is used. For the financial planning the following assumptions are made:

- 20% of length of road requires retaining wall on hill and valley side and the cross section of retaining is taken as 1.5 square meter
- 30% of the length of road requires gabion wall and the cross section of gabion is taken as 1 square meter
- full length of road requires longitudinal drainage structures
- Financial capacity of Rural Municipality increases by 10% each year

The table below presents a summary of the estimated costs to construct the recommended mid to long term transportation improvements. Construction costs for the road improvement have been estimated using unit costs provided by Department of Urban Development and Building Construction (DUDBC).

Table 18: Estimated Cost of Programs Featured in this RMTMP

S. No.	Project	Required Capital
1	Upgrading all roads inside rural municipality with necessary infrastructures	10,900,082,342
2	Maintenance of all roads	4,671,471,000
3	Construction of Bus Park with bus terminal	20,000,000
4	Construction of Bus Stands (1 in each ward)	15,000,000
5	Construction of Helipad for emergency (1 in each ward)	15,000,000
6	Installation of traffic signals at 10 locations	15,000,000
7	Traffic Safety and Signs	3,000,000
8	Road Safety education	3,000,000
Total		**15,642,553,342**

Based on this rate of item and total required interventions, a total of approximately 1564.26 crore of Nepalese rupees is projected to be required to develop transportation infrastructure and maintain them. For this, the assumption made is that the financial capacity of Rural Municipality increases by 10% each year. These costs will change slightly as the roads are improved and the standard costs change. This should be updated on annual basis.

4.3 Funding the Program

The cost of transportation infrastructure development and management is significantly higher than the capacity of Rural Municipality. For implementation of this RMTMP, Rural Municipality needs a capital of approximately **1564.26 crore** Nepalese rupees. However, the potential of Rural Municipality to invest in transportation infrastructure is **572.75 crore** Nepalese rupees (considering 25% of total capital of Rural Municipality and that capital of Rural Municipality increases by 10 percent each year) over twenty years period of time. The budget allocation for Construction and Maintenance of all roads inside rural municipality for 20 years period is shown in following table.

Table 19: Financial Requirement and Capacity of Rural Municipality

Year	Amount in Thousands		
	Required Capital	Capacity of Rural Municipality	Deficit in Capital
1	271,871	100,000	171,871
2	299,063	110,000	189,063
3	328,966	121,000	207,966
4	361,863	133,100	228,763
5	398,051	146,410	251,641
6	437,857	161,051	276,806
7	481,643	177,156	304,487
8	529,806	194,872	334,934
9	582,786	214,359	368,427
10	641,063	235,795	405,268
11	705,171	259,374	445,797
12	775,686	285,312	490,374
13	853,257	313,843	539,414
14	938,580	345,227	593,353
15	1,032,440	379,750	652,690
16	1,135,686	417,725	717,961
17	1,249,251	459,497	789,754
18	1,374,177	505,447	868,730
19	1,511,594	555,992	955,602
20	1,662,757	611,591	1,051,166
Total	**15,571,568**	**5,727,500**	**9,844,068**

The Rural Municipality needs to find sources for another **984.41 crore** Nepalese rupees for construction and maintenance of all roads inside rural municipality and **991.51 crore** Nepalese rupees for overall infrastructure development from different sources. The Rural Municipality should collaborate with federal government, province government and private sectors. Similarly, involving people in development works would help to generate revenue for infrastructure development. Likewise, Rural Municipality should increase their internal income through different income generating activities.

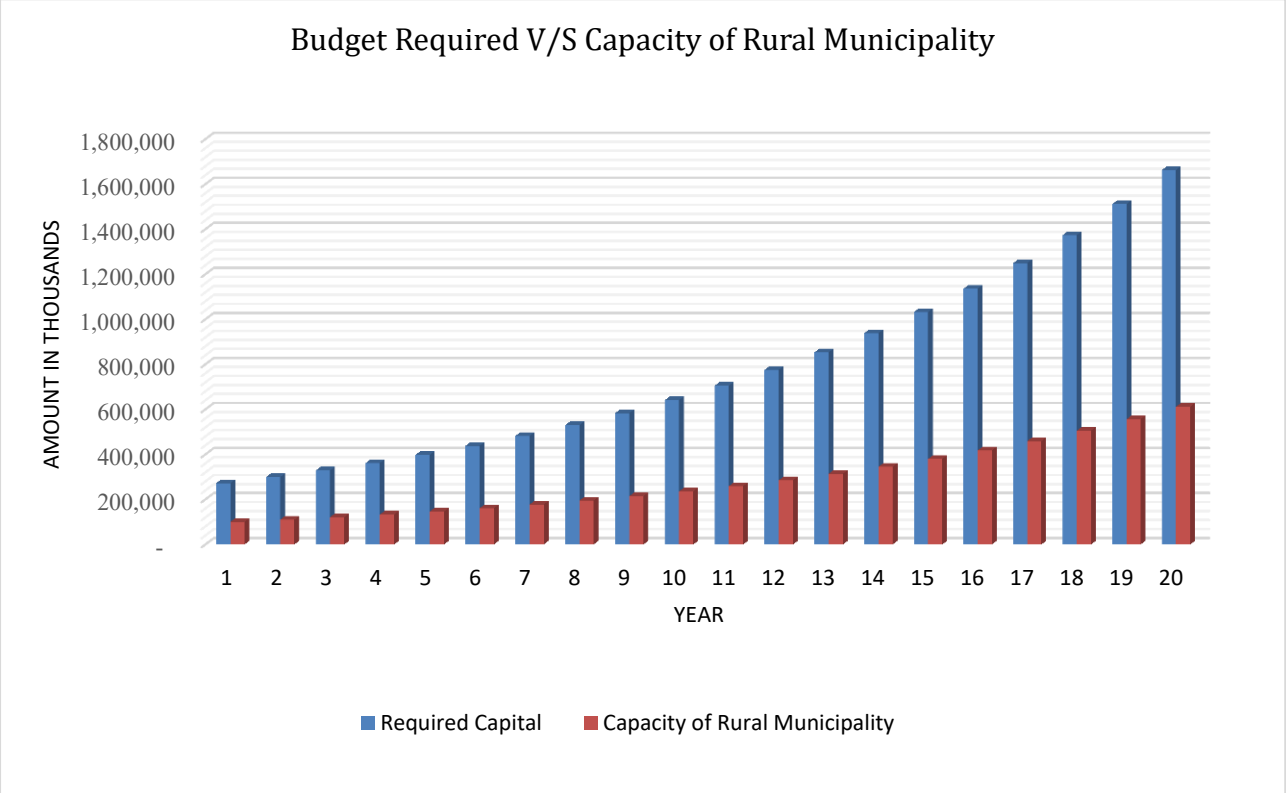

Figure 20: Required Capital vs Capacity of Rural Municipality

4.4 Scoring and Ranking of Rural Municipal Roads

As the financial resources of Rural Municipality is less as compared to the demand of people there is always conflict among the leaders from different parts for the development of road infrastructure. For this we have to prioritize roads, based on the certain conditions. For this RMTMP, we have adopted the criteria given by the ministry with discussion and minor modification with the concerned stakeholders. Based on these criteria, Rural Municipal and ward roads have been prioritized class-wise. The details of prioritization criteria are included in chapter 1 of of this report and prioritized roads are shown in table with detail of score and ranking.

Table 20: Score and Ranking of Rural Municipal Roads

Road Code	Road Name	Road Length (Km)	Score	Class wise Rank	Overall Rank
A001	Pipalbhanjyang Hayutar Netrakali (Belbot) Sadak	24.90	48.42	6	85

4.5 Maintenance and Improvement of Roads

i. Maintenance

Maintenance refers to the actions required to repair a road and keep it in good and passable condition. For RMTMP planning purposes, standard costs per kilometre for each maintenance type are applied to the entire road network, whereby for certain maintenance type's distinction is made according to the surface type of the road. Maintenance activities include:

Emergency maintenance - Basic repairs aimed at removing landslides and repairing damage to the road that inhibit the proper use of the road and make it impassable. This mainly takes place during and after the rainy season. A provisional lump sum is reserved for the entire road network based on the network length. Allocation to specific road sections is based on the actual need for clearing landslides or repairing washouts and cuts in the road.

Routine maintenance - General maintenance of the road aimed at preventing damage by ensuring the proper working of the different road elements (retaining walls, drainage system, carriageway, etc.) and cutting vegetation. This is carried out each year on a more or less continuous basis. Routine maintenance is required for the entire road network. The specific requirements for routine maintenance are determined on an annual basis through the road condition survey.

Recurrent maintenance - Repairs of minor damage to the road surface and road structures to bring them back to good condition. This is generally carried out once or twice a year. Recurrent maintenance is required for the entire Rural Municipal road network, whereby distinction is made according to the surface type. The specific requirements for recurrent maintenance are determined on an annual basis through the road condition survey.

Periodic maintenance - Larger repairs to the road largely aimed at renewing the road surface through re-gravelling, resealing or overlays. It is generally carried out with several years interval. Although periodic maintenance is only required for specific sections of the road network, a lump sum allocation is made for the entire road network based on average annual requirements, distinguishing between different surface types. The specific periodic maintenance requirements are determined on an annual basis through the annual road condition survey.

The length of roads in km to be included under each Maintenance type for the first year is indicated below.

Table 21: Length of road for maintenance work

ii. Improvement

Improvement refers to actions required to improve a road to bring it to a maintainable all-weather standard. It includes the following actions:

1. **Rehabilitation** - Significant repairs required to bring a very poor road back to a maintainable standard. This does not include any changes to the original surface type.

2. **Gravelling** - Placement of gravel layer to make it all-weather and ensure that the road remains passable during the rainy season.

3. **Cross drainage** - Placement of suitable cross-drainage structures with the aim of making the road all-weather and ensuring that the road remains passable even during the rainy season.

4. **Protective structures** - Placement of retaining walls and lined side drains to avoid excessive damage to the road during the rainy season and bring it to a maintainable standard.

5. **Blacktopping** - Placement of a blacktop layer in roads with traffic volumes exceeding 50 passenger car units (PCU) to reduce damage to the road surface.

6. **Widening** - Increase of the road width in roads with traffic volumes exceeding 500 passenger car units (PCU) to ensure the proper flow of traffic.

Table 23: Roads requiring cross drainage structures

4.6 Short Term (Five Year) Projected Financial Plan

To fulfil the required interventions implementation plan, financial requirements should be collected from the possible funding sources. For this, the present financial capacity of the Rural Municipality is considered to increase by 10% each year. The Rural Municipality aims to invest approximately 10 Crore of budget through Rural Municipality in road infrastructure in the following fiscal year and this budget will increase on the years following.

4.6.1 Sharing of Funds

The distribution of the available road sector budget for the RMTMP period is given by ToR is as given below figure. Out of 100% budget, 70% is allocated for the construction of roads and 30% is allocated for maintenance work. As this amount of budget for maintenance work is huge, this amount can also be used for the construction of drain and retaining structures while in the initial RMTMP period. After large network of road is developed, this amount will be used in maintenance work.

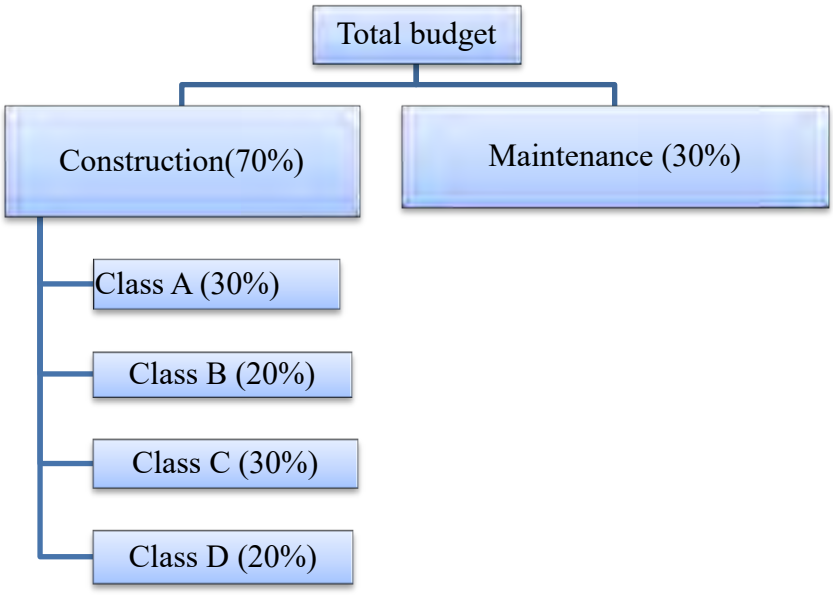

Figure 21: Distribution of Budget in RMTMP period

Based on the above distribution scheme of budget, the required annual budget will be as follows:

Table 25: First Five Year Projected Budget distribution

Year	Projected Budget (in Thousand)		
	Construction	Maintenance	Total
1	190,310	81,561	271,871
2	209,344	89,719	299,063
3	230,276	98,690	328,966
4	253,304	108,559	361,863
5	278,636	119,415	398,051
Total	**1,161,870**	**497,944**	**1,659,814**

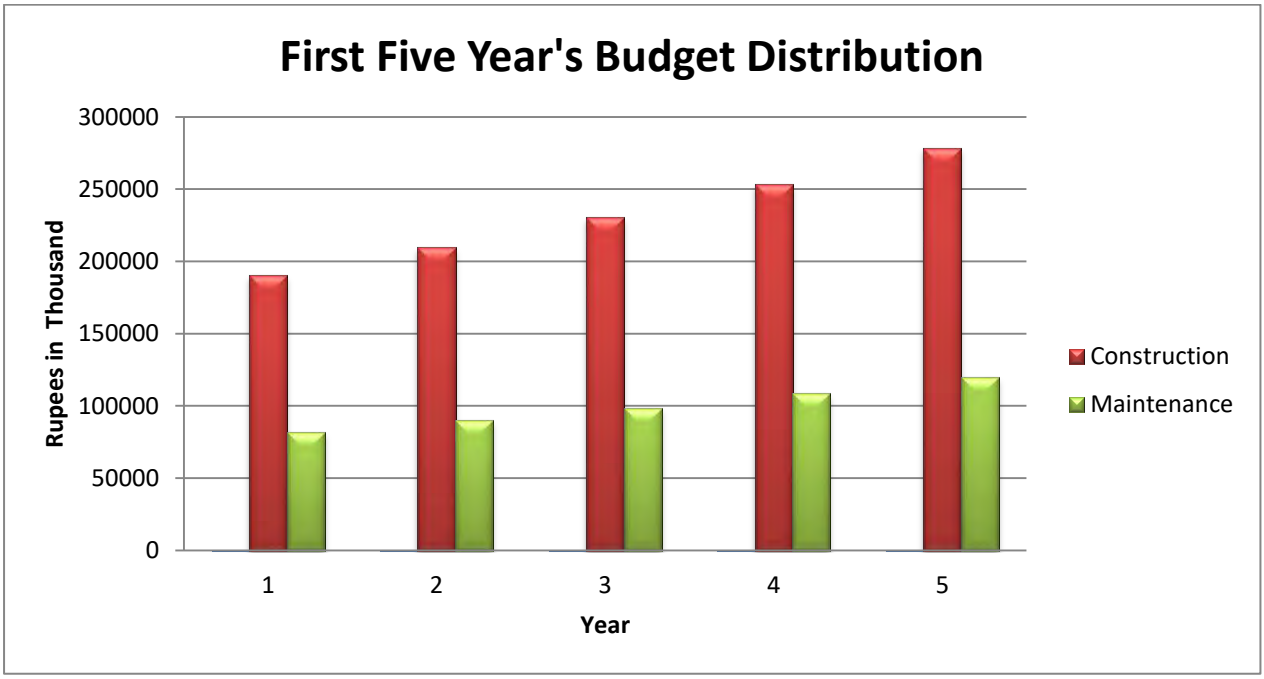

Figure 22: Projected Budget distribution for RMTMP period

Similarly, the projected construction budget for different classes of roads is as follow:

Table 26: First Five Year Projected construction Budget for different class of roads

Year	Projected Budget (in Thousand)					
	Class A	Class B	Class C	Class D	Maintenance	Total
1	57,093	38,062	57,093	38,062	81,561	271,871
2	62,803	41,869	62,803	41,869	89,719	299,063

4	75,991	50,661	75,991	50,661	108,559	361,863
5	83,591	55,727	83,591	55,727	119,415	398,051
Total	**348,561**	**232,374**	**348,561**	**232,374**	**497,944**	**1,659,814**

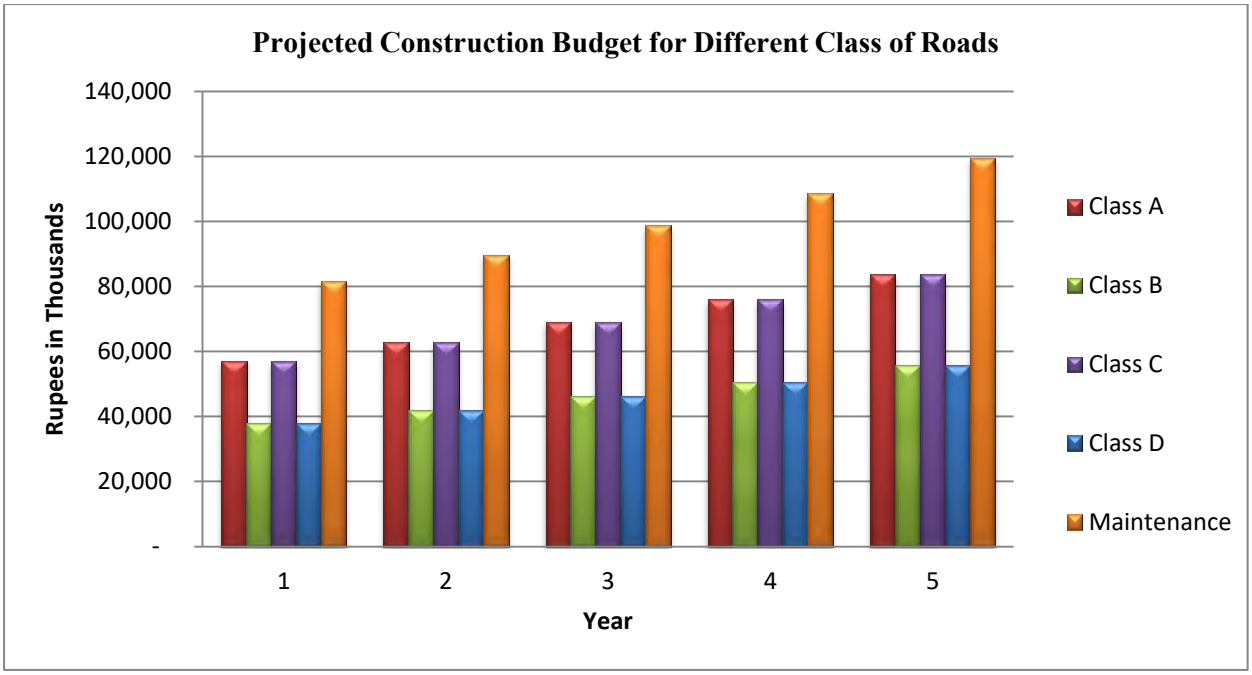

Figure 23: Projected Construction Budget for RMTMP period

4.6.2 First Five-Year Rural Municipality Transport Implementation Plan

For the implementation plan of RMTMP period, the following assumptions have been made:

- All class of roads are planned for upto all weather condition only
- Emphasis given to accessibility.
- Maintenance budget is considered to use in the construction/management of drain and retaining structures.

The investment plan for first five-year plan is as follows:

Table 27: First Five Year Investment Plan for Construction and maintenance of roads

Year	Capacity of Rural Municipality (in Thousands)		
	Construction	Maintenance	Total
1	70,000	30,000	100,000

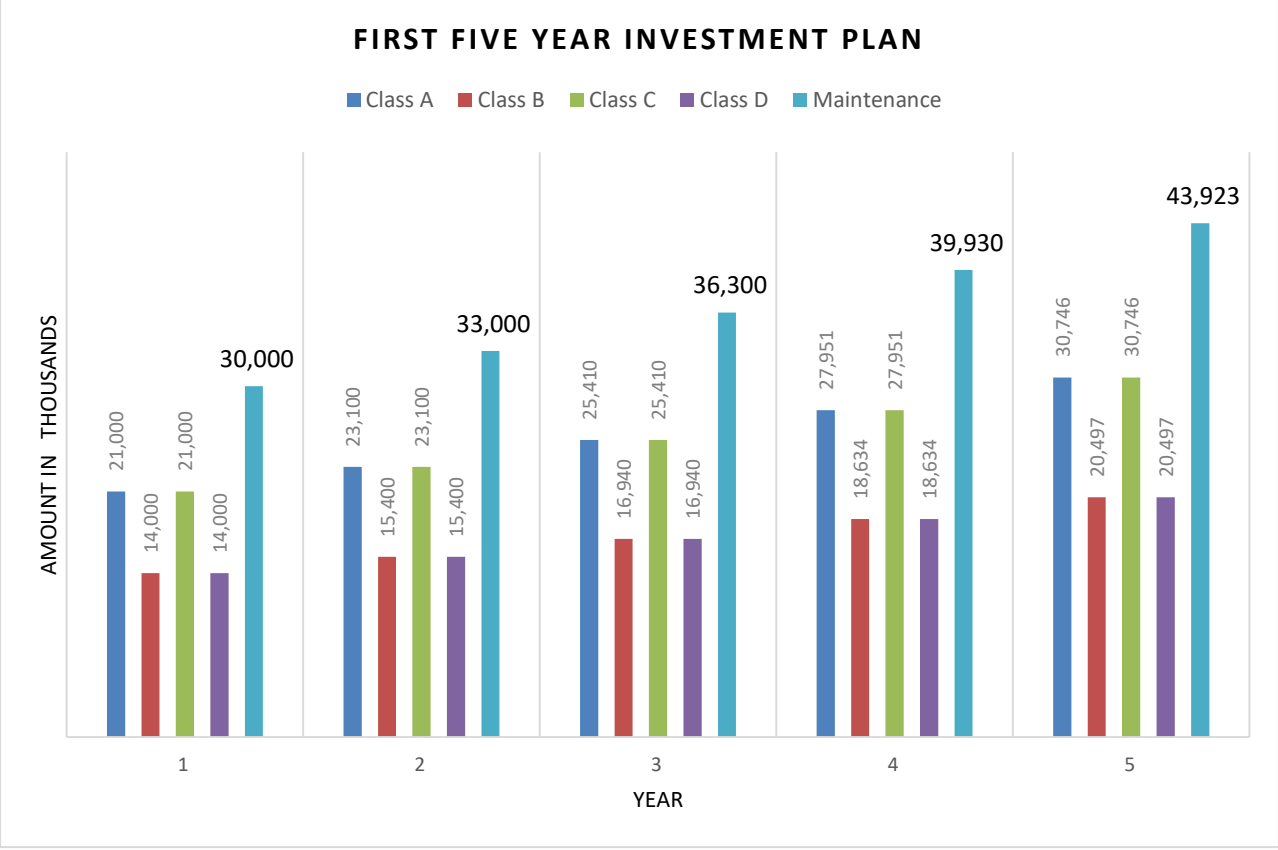

Figure 24: First Five Year Investment plan for RMTMP period

Chapter 6: Implementation and Monitoring of RMTMP

The RMTMP provides both long-term direction for the future development of the Rural Municipality's transportation system and a plan for immediate action, including several recommendations the Rural Municipality can implement through its regular activities. Successful implementation will ultimately require that concurrent efforts be undertaken to achieve the key strategies set out by Rural Municipality.

Inevitably forecasts and other assumptions made in preparing the RMTMP will prove imprecise or directions will change over time. As such, this RMTMP should be considered a starting point for transportation planning and monitoring. The plan should be updated regularly, at a minimum every 5 years.

The following sections provide guidance on implementing and monitoring this RMTMP.

6.1 Use of RMTMP

The RMTMP is the overarching strategic document that provides a framework for how the Rural Municipality will address its transportation needs to the year 2039. It describes, anticipates and plans for the movement of people and goods in a multi-modal, accessible transportation system. The RMTMP is not a provincially legislated document, and therefore has no statutory authority. That authority is provided through the Rural Municipality's Official Plan by incorporating the main policy directions of the RMTMP. The primary purpose of the RMTMP is to guide the Rural Municipality's transportation-related decision making and provide direction for its discussions and negotiations with other agencies and governments. It also provides the need and justification for transportation infrastructure projects that require approval from Rural Municipality, thereby satisfying long term plan of Rural Municipality of that process with problem or opportunity identification and evaluation of alternative solutions. In addition, the RMTMP is not just a plan of infrastructure actions. It provides the policy framework on which to make operational decisions for the Rural Municipality.

6.2 Community Outreach

Public involvement was an integral component of the plan development process and will be a key to successful implementation of the RMTMP and future updates of the plan. As a result of the extensive community engagement process, many individuals have identified an interest in being kept informed of the progress of the RMTMP and should be notified when the plan is complete

and available for viewing. The web site of Rural Municipality and other information systems inside Rural Municipality should continue to be the focal point for the dissemination of information regarding the RMTMP and implementation progress.

6.3 Integration with Official Plan and Programs of Rural Municipality

The policy and network recommendations of the RMTMP should be incorporated into the yearly plan and programs of Rural Municipality to provide the foundation and basis for implementation. The Rural Municipality should determine how and when to incorporate these recommendations into the yearly budget of Rural Municipality. Development of the RMTMP has had regard for on-going planning initiatives of other agencies. However, since several of those initiatives are still incomplete, it is conceivable that the Rural Municipality may be required to implement certain transportation aspects of the studies in its yearly plan

6.4 Monitoring the Plan

The RMTMP is not intended to be a static document. Rather it must be flexible and adapt to changes in travel characteristics, user behaviour, development trends, growth patterns and other unforeseen events over time. There are also several initiatives planned or underway by other agencies that may also have an effect on the recommendations of the RMTMP as they unfold. It is important to gather pertinent information about the Rural Municipal transportation system and factors affecting its use and development on a regular basis. A clear understanding of changing conditions and progress enables more informed implementation decisions and priority setting. It also assists in assessing how well the Rural Municipality is progressing towards its Transportation Vision and supports reviews of the RMTMP itself. Regular monitoring allows progress to be tracked and performance to be measured and reported. The program would feature monitoring to assess changes in transportation system performance over time.

6.5 Plan Review and Update

Regular reviews and updates of the RMTMP allow for the on-going assessment of its effectiveness and relevance. Establishing this stable transportation planning cycle ensures the plan strategies remain flexible to respond to unforeseen developments and imprecise assumptions. The performance of the plan in achieving the Transportation Vision can also be

reviewed, and necessary adjustments in strategy made. As well, the consultant recommends that master plans be reviewed every five years to determine the need for a detailed formal review and/or updating.

The review process provides a timely opportunity to revisit the assumptions of the RMTMP and consider the need for an update. The monitoring program discussed in above will also provide an indication of the need for a review.

All future RMTMP updates should include a comprehensive and proactive public outreach program. This program should include Public Information Centres, stakeholder workshops and other innovative outreach strategies that solicit input from all residents within the Rural Municipality, including youth and the transportation disadvantaged.

Over the time period preceding the formal review, Rural Municipal body's decisions on transportation issues will have the inevitable effect of amending, deleting, replacing or complementing some of the policies in the RMTMP. For this reason, individuals must consider this plan in conjunction with the record of subsequent Rural Municipal decisions to obtain a complete understanding of current policy and plans. The Rural Municipality may amend the RMTMP in the intervening period to incorporate substantive changes or major initiatives, but on-going updates are not contemplated.

Chapter 7: CONCLUSION

The report of RMTMP of Ghyanglekh Rural Municipality is prepared after the analysis of field data and requirement of the Rural Municipality itself. This RMTMP planning is based on the assumption that the spending capacity of Municipality increases by 10% per year. The total budget for 20 years of implementation of this RMTMP is projected to be **1564.26 Crore** Nepalese rupees. Among that total budget, for road construction and maintenance the total budget required is **1557.16 Crore** Nepalese rupees, 70% of which is allocated for construction and 30% is allocated for maintenance of existing structures. The ultimate goal of this RMTMP is to blacktop all the Municipality roads to their full extent.

The overall road network along with location points are shown in a interactive online map with satellite basemap. The details of the roads and locations can be obtained from the interactive map through the following link::

https://www.arcgis.com/apps/View/index.html?appid=4c2b73dec27d4cb9823e3655a8c2d8d8

For convenience, the above link has been shortened as::

https://www.tinyurl.com/Ghanglekhroads

(Using any of the above links redirects to the same map.)

The concept of RMTMP is to develop sustainable and economic road network; therefore, the Rural Municipality should focus on strengthening existing road network to operate them in all weather conditions rather than opening new tracks. Moreover, strategically important tracks should be opened after proper planning and design. Due to unavailability of intra municipal transport system, the number of private vehicles is increasing in the Rural Municipality which may cause severe problem of traffic congestion in future. So, Municipality should take immediate action to operate local transport system inside the Rural Municipality by Rural Municipality itself or with collaboration with private entities. Similarly, the Rural Municipality should allocate different land use zones based on their current and future use, which will be applicable in future planning of infrastructure facilities inside Rural Municipaliy.
